**NON-ENDOGENOUS, CONSTITUTIVELY ACTIVATED  
HUMAN SEROTONIN RECEPTORS AND SMALL  
MOLECULE MODULATORS THEREOF**

5 The benefit of U.S. Serial Number 09/060,188, filed April 14, 1998 (owned by  
Arena Pharmaceuticals, Inc.) and U.S. Provisional Number 60/090,783, filed June 26, 1998  
(owned by Arena Pharmaceuticals), U.S. Provisional Number 60/112,909, filed December  
18, 1998, and U.S. Provisional Number 60/123,000 filed March 5, 1999 is hereby claimed.

## **FIELD OF THE INVENTION**

The present invention relates to non-endogenous, constitutively active serotonin receptors and small molecule modulators thereof.

## **BACKGROUND OF THE INVENTION**

## I. G protein-coupled receptors

G protein-coupled receptors share a common structural motif. All these receptors have seven sequences of between 22 to 24 hydrophobic amino acids that form seven alpha helices, each of which spans the membrane. The transmembrane helices are joined by strands of amino acids having a larger loop between the fourth and fifth transmembrane helix on the extracellular side of the membrane. Another larger loop, composed primarily of hydrophilic amino acids, joins transmembrane helices five and six on the intracellular side of the membrane. The carboxy terminus of the receptor lies intracellularly with the amino terminus in the extracellular space. It is thought that the loop joining helices five and six, as well as, the carboxy terminus, interact with the G protein. Currently, Gq, Gs, Gi, and Go are G proteins that have been identified. The general structure of G protein-coupled receptors is shown in Figure 1.

Under physiological conditions, G protein-coupled receptors exist in the cell membrane in equilibrium between two different states or conformations: an “inactive” state and an “active” state. As shown schematically in Figure 2, a receptor in an inactive state is unable to link to the intracellular transduction pathway to produce a biological response. Changing the receptor conformation to the active state allows linkage to the transduction pathway and produces a biological response.

A receptor may be stabilized in an active state by an endogenous ligand or an exogenous agonist ligand. Recent discoveries such as, including but not exclusively limited to, modifications to the amino acid sequence of the receptor provide means other than ligands to stabilize the active state conformation. These means effectively stabilize the receptor in an active state by simulating the effect of a ligand binding to the receptor. Stabilization by such ligand-independent means is termed "constitutive receptor activation."

## II. Serotonin receptors

Receptors for serotonin (5-hydroxytryptamine, 5-HT) are an important class of G protein-coupled receptors. Serotonin is thought to play a role in processes related to learning and memory, sleep, thermoregulation, mood, motor activity, pain, sexual and aggressive behaviors, appetite, neurodegenerative regulation, and biological rhythms. Not surprisingly, serotonin is linked to pathophysiological conditions such as anxiety, depression, obsessive-compulsive disorders, schizophrenia, suicide, autism, migraine, emesis, alcoholism and neurodegenerative disorders.

Serotonin receptors are divided into seven subfamilies, referred to as 5-HT1 through 5-HT7, inclusive. These subfamilies are further divided into subtypes. For example, the 5-HT2 subfamily is divided into three receptor subtypes: 5-HT2A, 5-HT2B, and 5-HT2C. The human 5-HT2C receptor was first isolated and cloned in 1987, and the human 5-HT2A receptor was first isolated and cloned in 1990. These two receptors are thought to be the site of action of hallucinogenic drugs. Additionally, antagonists to the 5-HT2A and 5-HT2C receptors are believed to be useful in treating depression, anxiety, psychosis and eating disorders.

U.S. Patent Number 4,985,352, describes the isolation, characterization, and expression of a functional cDNA clone encoding the entire human 5-HT1C receptor (now known as the 5HT2C receptor). U.S. Patent Number 5,661,0124 describes the isolation, characterization, and expression of a functional cDNA clone encoding the entire human 5-HT2A receptor.

Mutations of the endogenous forms of the rat 5-HT2A and rat 5-HT2C receptors have been reported to lead to constitutive activation of these receptors (5-HT2A: Casey, C. *et al.* (1996) *Society for Neuroscience Abstracts*, 22:699.10, hereinafter "Casey"; 5-HT2C: Herrick-Davis, K., and Teitler, M. (1996) *Society for Neuroscience Abstracts*, 22:699.18, hereinafter "Herrick-Davis 1"; and Herrick-Davis, K. *et al.* (1997) *J.Neurochemistry* 69(3): 1138, hereinafter "Herrick-Davis-2"). Casey describes a mutation of the cysteine residue at position 322 of the rat 5-HT2A receptor to lysine (C322K), glutamine (C322Q) and arginine (C322R) which reportedly led to constitutive activation. Herrick-Davis 1 and Herrick-Davis 2 describe

mutations of the serine residue at position 312 of the rat 5-HT2C receptor to phenylalanine (S312F) and lysine (S312K), which reportedly led to constitutive activation.

### SUMMARY OF THE INVENTION

The present invention relates to non-endogenous, constitutively activated forms of the human 5-HT2A and human 5-HT2C receptors and various uses of such receptors. Further disclosed are small molecule modulators of these receptors. Most preferably, these modulators have inverse agonist characteristics at the receptor.

More specifically, the present invention discloses nucleic acid molecules and the proteins for three non-endogenous, constitutively activated human serotonin receptors, referred to herein as, AP-1, AP-3, and AP-4. The AP-1 receptor is a constitutively active form of the human 5-HT2C receptor created by an S310K point mutation. The AP-3 receptor is a constitutively active form of the human 5-HT2A receptor whereby the intracellular loop 3 (IC3) portion and the cytoplasmic-tail portion of the endogenous human 5-HT2A receptor have been replaced with the IC3 portion and the cytoplasmic-tail portion of the human 5-HT2C receptor. The AP-4 receptor is a constitutively active form of the human 5-HT2A receptor whereby (1) the region of the intracellular third loop between the proline of the transmembrane 5 region (TM5) and the proline of TM6 of the endogenous human 5-HT2A receptor has been replaced with the corresponding region of the human 5-HT2C receptor (including a S310K point mutation); and (2) the cytoplasmic-tail portion of the endogenous human 5-HT2A receptor has been replaced with the cytoplasmic-tail portion of the endogenous human 5-HT2C receptor.

The invention also provides assays that may be used to directly identify candidate compounds as agonists, partial agonists or inverse agonists to non-endogenous, constitutively activated human serotonin receptors; such candidate compounds can then be utilized in pharmaceutical composition(s) for treatment of diseases and disorders which are related to the human 5-HT2A and/or human 5-HT2C receptors.

These and other aspects of the invention disclosed herein will be set forth in greater detail as the patent disclosure proceeds.

### BRIEF DESCRIPTION OF THE DRAWINGS

In the following figures, bold typeface indicates the location of the mutation in the non-endogenous, constitutively activated receptor relative to the corresponding endogenous receptor.

**Figure 1** shows a generalized structure of a G protein-coupled receptor with the numbers assigned to the transmembrane helices, the intracellular loops, and the extracellular loops.

**Figure 2** schematically shows the active and inactive states for a typical G protein-coupled receptor and the linkage of the active state to the second messenger transduction pathway.

**Figure 3a** provides the nucleic acid sequence of the endogenous human 5-HT2A receptor (SEQ.ID.NO: 24).

**Figure 3b** provides the corresponding amino acid sequence of the endogenous human 5-HT2A receptor (SEQ.ID.NO: 25).

**Figure 4a** provides the nucleic acid sequence of the endogenous human 5-HT2C receptor (SEQ.ID.NO: 26).

**Figure 4b** provides the corresponding amino acid sequence of the endogenous human 5-HT2C receptor (SEQ.ID.NO: 27).

**Figure 5a** provides the nucleic acid sequence of a constitutively active form of the human 5-HT2C receptor (“AP-1 cDNA” – SEQ.ID.NO: 28).

**Figure 5b** provides the corresponding amino acid sequence of the AP-1 cDNA (“AP-1” – SEQ.ID.NO: 29).

**Figure 6a** provides the nucleic acid sequence of a constitutively active form of the human 5-HT2A receptor whereby the IC3 portion and the cytoplasmic-tail portion of the endogenous 5-HT2A receptor have been replaced with the IC3 portion and the cytoplasmic-tail portion of the human 5-HT2C receptor (“AP-3 cDNA” – SEQ.ID.NO: 30).

**Figure 6b** provides the corresponding amino acid sequence of the AP-3 cDNA (“AP-3” – SEQ.ID.NO: 31).

**Figure 6c** provides a schematic representation of AP-3, where the dashed-lines represent the portion obtained from the human 5-HT2C receptor.

**Figure 7a** provides the nucleic acid sequence of a constitutively active form of the human 5-HT2A receptor whereby (1) the region of the between the proline of TM5 and the proline of TM6 of the endogenous human 5-HT2A receptor has been replaced with the corresponding region of the human 5-HT2C receptor (including a S310K point mutation); and (2) the cytoplasmic-tail portion of the endogenous 5-HT2A receptor has been replaced with the cytoplasmic-tail portion of the endogenous human 5-HT2C receptor (“AP-4 cDNA” – SEQ.ID.NO:32).

**Figure 7b** provides the corresponding amino acid sequence of the AP-4 cDNA ("AP-4" – SEQ.ID.NO: 33).

**Figure 7c** provides a schematic representation of the mutated 5-HT2A receptor of Figure 7b where the dashed-lines represent the portion obtained from the human 5-HT2C receptor.

**Figure 8** is a representation of the preferred vector, pCMV, used herein.

**Figure 9** is a diagram illustrating (1) enhanced [<sup>35</sup>S]GTP $\gamma$ S binding to membranes prepared from COS cells expressing the endogenous human 5-HT2C receptor in response to serotonin, and (2) inhibition by mianserin using wheatgerm agglutinin scintillation proximity beads. The concentration of [<sup>35</sup>S]GTP $\gamma$ S was held constant at 0.3 nM, and the concentration of GDP was held at 1  $\mu$ M. The concentration of the membrane protein was 12.5  $\mu$ g.

**Figure 10** is a diagram showing serotonin stimulation of [<sup>35</sup>S]GTP $\gamma$ S binding to membranes expressing AP-1 receptors in 293T cells and the inhibition by 30  $\mu$ M mianserin on Wallac<sup>TM</sup> scintistrips.

**Figure 11** is a diagram showing the effects of protein concentration on [<sup>35</sup>S]GTP $\gamma$ S binding in membranes prepared from 293T cells transfected with the endogenous human 5-HT2C receptors and AP-1 receptors compared to cells transfected with the control vector (pCMV) alone in the absence (A) and presence (B) of 10  $\mu$ M serotonin. The radiolabeled concentration of [<sup>35</sup>S]GTP $\gamma$ S was held constant at 0.3 nM, and the GDP concentration was held constant at 1  $\mu$ M. The assay was performed on 96-well format on Wallac<sup>TM</sup> scintistrips.

**Figure 12** provides bar-graph comparisons of inositol trisphosphate ("IP3") production between the endogenous human 5HT2A receptor and AP-2, a mutated form of the receptor.

**Figure 13** provides bar-graph comparisons of inositol trisphosphate ("IP3") production between the endogenous human 5HT2A receptor and AP-4, a mutated form of the receptor.

**Figure 14** provides bar graph comparisons of IP3 production between the endogenous human 5-HT2A receptor and AP-3, a mutated form of the receptor.

**Figure 15** provides bar-graph comparisons of IP3 production between the endogenous human 5-HT2C receptor and AP-1.

**Figures 16A-C** provides representative autoradiograms showing displacement of I<sup>125</sup>-LSD from brain sections by spiperone and compound 116100.

**Figure 17** shows in vivo response of animals to 116102 exposure.

## DEFINITIONS

The scientific literature that has evolved around receptors has adopted a number of terms to refer to ligands having various effects on receptors. For clarity and consistency, the following definitions will be used throughout this patent document. To the extent that these 5 definitions conflict with other definitions for these terms, the following definitions shall control.

**AGONISTS** shall mean moieties that activate the intracellular response when they bind to the receptor, or enhance GTP binding to membranes.

**AMINO ACID ABBREVIATIONS** used herein are set out in Table 1:

**TABLE 1**

ALANINE	ALA	A
ARGININE	ARG	R
ASPARAGINE	ASN	N
ASPARTIC ACID	ASP	D
CYSTEINE	CYS	C
GLUTAMIC ACID	GLU	E
GLUTAMINE	GLN	Q
GLYCINE	GLY	G
HISTIDINE	HIS	H
ISOLEUCINE	ILE	I
LEUCINE	LEU	L
LYSINE	LYS	K
METHIONINE	MET	M
PHENYLALANINE	PHE	F
PROLINE	PRO	P

SERINE	SER	S
THREONINE	THR	T
TRYPTOPHAN	TRP	W
TYROSINE	TYR	Y
VALINE	VAL	V

**PARTIAL AGONISTS** shall mean moieties which activate the intracellular response when they bind to the receptor to a lesser degree/extent than do agonists, or enhance GTP binding to membranes to a lesser degree/extent than do agonists.

5       **ANTAGONIST** shall mean moieties that competitively bind to the receptor at the same site as the agonists but which do not activate the intracellular response initiated by the active form of the receptor, and can thereby inhibit the intracellular responses by agonists or partial agonists. ANTAGONISTS do not diminish the baseline intracellular response in the absence of an agonist or partial agonist.

10      **CANDIDATE COMPOUND** shall mean a molecule (for example, and not limitation, a chemical compound) which is amenable to a screening technique.

**COMPOUND EFFICACY** shall mean a measurement of the ability of a compound to inhibit or stimulate receptor functionality, as opposed to receptor binding affinity.

15      **CONSTITUTIVELY ACTIVATED RECEPTOR** shall mean a receptor subject to constitutive receptor activation.

**CONSTITUTIVE RECEPTOR ACTIVATION** shall mean stabilization of a receptor in the active state by means other than binding of the receptor with its endogenous ligand or a chemical equivalent thereof.

20      **CONTACT** or **CONTACTING** shall mean bringing at least two moieties together, whether in an in vitro system or an in vivo system.

**ENDOGENOUS** shall mean a material that a mammal naturally produces. ENDOGENOUS in reference to, for example and not limitation, the term "receptor" shall mean that which is naturally produced by a mammal (for example, and not limitation, a human) or a virus.

25      In contrast, the term **NON-ENDOGENOUS** in this context shall mean that which is not naturally produced by a mammal (for example, and not limitation, a human) or a virus. For

example, and not limitation, a receptor which is not constitutively active in its endogenous form, but when manipulated becomes constitutively active, is most preferably referred to herein as a “non-endogenous, constitutively activated receptor.” Both terms can be utilized to describe both “in vivo” and “in vitro” systems. For example, and not a limitation, in a screening approach, the endogenous or non-endogenous receptor may be in reference to an in vitro screening system. As a further example and not limitation, where the genome of a mammal has been manipulated to include a non-endogenous constitutively activated receptor, screening of a candidate compound by means of an in vivo system is viable.

INHIBIT or INHIBITING, in relationship to the term “response” shall mean that a response is decreased or prevented in the presence of a compound as opposed to in the absence of the compound.

INVERSE AGONISTS shall mean moieties that bind the endogenous form of the receptor or to the constitutively activated form of the receptor, and which inhibit the baseline intracellular response initiated by the active form of the receptor below the normal base level of activity which is observed in the absence of agonists or partial agonists, or decrease GTP binding to membranes. Preferably, the baseline intracellular response is inhibited in the presence of the inverse agonist by at least 30%, more preferably by at least 50%, and most preferably by at least 75%, as compared with the baseline response in the absence of the inverse agonist.

LIGAND shall mean an endogenous, naturally occurring molecule specific for an endogenous, naturally occurring receptor.

PHARMACEUTICAL COMPOSITION shall mean a composition comprising at least one active ingredient, whereby the composition is amenable to investigation for a specified, efficacious outcome in a mammal (for example, and not limitation, a human). Those of ordinary skill in the art will understand and appreciate the techniques appropriate for determining whether an active ingredient has a desired efficacious outcome based upon the needs of the artisan.

STIMULATE or STIMULATING, in relationship to the term “response” shall mean that a response is increased in the presence of a compound as opposed to in the absence of the compound.

## DETAILED DESCRIPTION

### I. Particularly preferred mutations

For convenience, the sequence information regarding the non-endogenous, constitutively active human 5-HT2A and 5-HT2C receptors are referred to by identifiers as set forth in Table 2:

TABLE 2

IDENTIFIER	RECEPTOR	SEQ.ID.NO:	FIGURE
AP-1 cDNA	5-HT2C	28	5a
AP-1	5-HT2C	29	5b
AP-3 cDNA	5-HT2A	30	6a
AP-3	5-HT2A	31	6b
AP-4 cDNA	5-HT2A	32	7a
AP-4	5-HT2A	33	7b

5 As will be discussed in greater detail below, a mutation analogous to that reported by Casey (C322K) was utilized in the human 5-HT2A receptor and is referred to herein as AP-2. However, AP-2 did not lead to sufficient constitutive activation to allow for utilization in screening techniques.

## II. Introduction

10 While it is sometimes possible to make predictions as to the effect of nucleic acid manipulation from one species to another, this is not always the case. The results reported by Casey suggest that a point mutation in the rat 5-HT2A receptor evidences constitutive activation of the mutated receptor. Casey reports that the C322K mutation was approximately four fold more active than the native rat 5-HT2A receptor. However, for purposes of a most preferred use, i.e., screening of candidate compounds, this corresponding mutation in the human 5-HT2A receptor had little discernable effect in evidencing constitutive activation of the human receptor. This, of course, creates the reasonable conclusion that the information reported in Herrick-Davis 1 or Herrick-Davis 2 is of limited predictive value relative to the manipulation of the human 5-HT2C receptor. Consequently, the ability to make reasonable predictions about the effects of mutations to the rat 5-HT receptors vis-à-vis the corresponding human receptors is not possible. Nonetheless, this unfortunate lack of reasonable predictability

provides the opportunity for others to discover mutations to the human 5-HT receptors that provide evidence of constitutive activation.

Therefore, the present invention is based upon the desire of defining mutated sequences of the human serotonin receptors 5-HT2A and 5-HT2C whereby such mutated versions of the expressed receptor are constitutively active. These constitutively active receptors allow for, inter alia, screening candidate compounds.

What has been discovered and disclosed herein is that substantial activation of the human 5-HT2A receptor can be obtained by "domain swapping," i.e., by switching the third intracellular domain of the 5-HT2A receptor with the third intracellular domain of the 5-HT2C receptor. Additionally, swapping the cytoplasmic tail of the two receptors further increases the IP<sub>3</sub> response. Furthermore, mutation of the serine at position 310 to lysine (S310K) of the human 5-HT2C receptor leads to constitutive activation.

What follows is a most preferred approach to identification of candidate compounds; those in the art will readily appreciate that the particular order of screening approaches, and/or whether or not to utilize certain of these approaches, is a matter of choice. Thus, the order presented below, set for presentational efficiency and for indication of the most preferred approach utilized in screening candidate compounds, is not intended, nor is to be construed, as a limitation on the disclosure, or any claims to follow.

### III. Generic G Protein-Coupled Receptor screening assay techniques

When a G protein receptor becomes constitutively active, it binds to a G protein (G<sub>q</sub>, G<sub>s</sub>, G<sub>i</sub>, G<sub>o</sub>) and stimulates the binding of GTP to the G protein. The G protein then acts as a GTPase and slowly hydrolyzes the GTP to GDP, whereby the receptor, under normal conditions, becomes deactivated. However, constitutively activated receptors continue to exchange GDP to GTP. A non-hydrolyzable analog of GTP, [<sup>35</sup>S]GTPγS, can be used to monitor enhanced binding to membranes which express constitutively activated receptors. It is reported that [<sup>35</sup>S]GTPγS can be used to monitor G protein coupling to membranes in the absence and presence of ligand. An example of this monitoring, among other examples well-known and available to those in the art, was reported by Traynor and Nahorski in 1995. The preferred use of this assay system is for initial screening of candidate compounds because the system is generically applicable to all G protein-coupled receptors regardless of the particular G protein that interacts with the intracellular domain of the receptor.

**IV. Confirmation of G Protein-Coupled Receptor site screening assay techniques**

Once candidate compounds are identified using the "generic" G protein-coupled receptor assay (i.e. an assay to select compounds that are agonists, partial agonists, or inverse agonists), further screening to confirm that the compounds have interacted at the receptor site 5 is preferred. For example, a compound identified by the "generic" assay may not bind to the receptor, but may instead merely "uncouple" the G protein from the intracellular domain. Thus, by further screening those candidate compounds, which have been identified using a "generic" assay in an agonist and/or antagonist competitive binding assay, further refinement in the selection process is provided.

10 Lysergic acid diethylamide (LSD) is a well-known agonist of the 5-HT2A and 5-HT2C receptors, while mesulergine is a well-known antagonist to the 5-HT2C receptor. Accordingly, in most preferred embodiments, an agonist (LSD) and/or antagonist (mesulergine) competitive binding assay(s) is used to further screen those compounds selected from the "generic" assay for confirmation of serotonin receptor binding.

**15 V. Specified G Protein assay techniques**

The art-accepted physiologically mediated pathway for the human 5-HT2A and 5-HT2C receptors is via Gq. Intracellular accumulation of IP<sub>3</sub> can be used to confirm constitutive activation of these types of Gq coupled receptors (*see* Herrick-Davis-1). As a result, "IP<sub>3</sub> accumulation" assays can be used to further screen those compounds selected from 20 an agonist and/or antagonist competitive binding assay.

**VI. Pharmaceutical compositions**

Candidate compounds selected for further development can be formulated into pharmaceutical compositions using techniques well known to those in the art. Suitable pharmaceutically-acceptable carriers are available to those in the art; for example, see 25 Remington's Pharmaceutical Sciences, 16<sup>th</sup> Edition, 1980, Mack Publishing Co., (Oslo et al., eds.)

**EXAMPLES**

The following examples are presented for purposes of elucidation, and not limitation, of the present invention. While specific nucleic acid and amino acid sequences 30 are disclosed herein, those of ordinary skill in the art are credited with the ability to make minor modifications to these sequences while achieving the same or substantially similar results reported below. It is intended that equivalent, non-endogenous, constitutively

activated human serotonin receptor sequences having eighty-five percent (85%) homology, more preferably having ninety percent (90%) homology, and most preferably having ninety-five percent (95%) homology to the disclosed and claimed sequences all fall within the scope of any claims appended hereto.

##### A. Construction of constitutively active 5-HT2C receptor cDNA

###### 1. *Endogenous Human 5-HT2C*

The cDNA encoding endogenous human 5-HT2C receptor was obtained from human brain poly-A<sup>+</sup> RNA by RT-PCR. The 5' and 3' primers were derived from the 5' and 3' untranslated regions and contained the following sequences:

5'-GACCTCGAGGTTGCTTAAGACTGAAGCA-3' (SEQ.ID.NO:1)

5'-ATTCTAGACATATGTAGCTTGTACCGT-3' (SEQ.ID.NO:2)

PCR was performed using either TaqPlus™ precision polymerase (Stratagene) or rTth™ polymerase (Perkin Elmer) with the buffer systems provided by the manufacturers, 0.25 μM of each primer, and 0.2 mM of each of the four (4) nucleotides. The cycle condition was 30 cycles of 94°C for 1 minute, 57 °C for 1 minute and 72 °C for 2 minutes. The 1.5 kb PCR fragment was digested with Xho I and Xba I and subcloned into the Sal I-Xba I site of pBluescript.

The derived cDNA clones were fully sequenced and found to correspond to published sequences.

**2. AP-1 cDNA**

The cDNA containing a S310K mutation (AP-1 cDNA) in the third intracellular loop of the human 5-HT<sub>2C</sub> receptor was constructed by replacing the Sty I restriction fragment containing amino acid 310 with synthetic double stranded oligonucleotides encoding the 5 desired mutation. The sense strand sequence utilized had the following sequence:

5'-

CTAGGGGCACCATGCAGGCTATCAACAATGAAAGAAAAAGCTAAGAAAGTC-3'

(SEQ. ID.NO: 3)

and the antisense strand sequence utilized had the following sequence:

10 5'-CAAGGACTTCTTAGCTTTCTTCATTGTTGATAGCCTGCATGGT  
GCC-3' (SEQ. ID. NO: 4).

**B. Construction of constitutively active 5-HT<sub>2A</sub> receptor cDNA****I. Endogenous Human 5-HT<sub>2A</sub>**

The cDNA encoding endogenous human 5-HT<sub>2A</sub> receptor was obtained by RT-PCR 15 using human brain poly-A<sup>+</sup> RNA; a 5' primer from the 5' untranslated region with a Xho I restriction site:

5'-GACCTCGAGTCCTTCTACACCTCATC-3' (SEQ.ID.NO:5)

and a 3' primer from the 3' untranslated region containing an Xba I site:

5'-TGCTCTAGATTCCAGATAGGTGAAAA CTTG-3' (SEQ.ID.NO:6).

20 PCR was performed using either TaqPlus™ precision polymerase (Stratagene) or rTth™ polymerase (Perkin Elmer) with the buffer systems provided by the manufacturers, 0.25 μM of each primer, and 0.2 mM of each of the four (4) nucleotides. The cycle condition was 30 cycles of 94°C for 1 minute, 57 °C for 1 minute and 72 °C for 2 minutes. The 1.5 kb PCR fragment was digested with Xba I and subcloned into the Eco RV-Xba I site of pBluescript.

25 The resulting cDNA clones were fully sequenced and found to encode two amino acid changes from the published sequences. The first change is a T25N mutation in the N-terminal extracellular domain and the second change is an H452Y mutation. These mutations are likely to represent sequence polymorphisms rather than PCR errors since the cDNA clones having the same two mutations were derived from two independent PCR 30 procedures using Taq polymerase from two different commercial sources (TaqPlus™ Stratagene and rTth™ Perkin Elmer).

**2. Human 5-HT<sub>2A</sub> (C322K; AP-2)**

The cDNA containing the point mutation C322K in the third intracellular loop was constructed by using the Sph I restriction enzyme site, which encompasses amino acid 322. For the PCR procedure, a primer containing the C322K mutation:

5' -CAAAGAAAGTACTGGGCATCGTCTTCCT-3' (SEQ.ID.NO:7)

5 was used along with the primer from the 3' untranslated region set forth above as SEQ.ID.NO:6. The resulting PCR fragment was then used to replace the 3' end of the wild type 5-HT<sub>2A</sub> cDNA by the T4 polymerase blunted Sph I site. PCR was performed using pfu polymerase (Stratagene) with the buffer system provided by the manufacturer and 10% DMSO, 0.25 mM of each primer, 0.5mM of each of the 4 nucleotides. The cycle conditions  
10 were 25 cycles of 94°C for 1 minute, 60°C for 1 minute and 72°C for 1 minute.

### 3. AP-3 cDNA

The human 5-HT2A cDNA with intracellular loop 3 (IC3) or IC3 and cytoplasmic tail replaced by the corresponding human 5-HT2C cDNA was constructed using PCR-based mutagenesis.

5 (a) *Replacement of IC3 Loop*

The IC3 loop of human 5-HT2A cDNA was first replaced with the corresponding human 5-HT2C cDNA. Two separate PCR procedures were performed to generate the two fragments, Fragment A and Fragment B, that fuse the 5-HT2C IC3 loop to the transmembrane 6 (TM6) of 5-HT2A. The 237 bp PCR fragment, Fragment A, containing 5-HT2C IC3 and the initial 13 bp of 5-HT2A TM6 was amplified by using the following primers:

5'-CCGCTCGAGTACTGCGCCGACAAGCTTGAT-3' (SEQ.ID.NO:8)

5'-CGATGCCAGCACTTCGAAGCTTTCTTCATTGTTG3' (SEQ.ID.NO:9)

The template used was human 5-HT2C cDNA.

15 The 529 bp PCR fragment, Fragment B, containing the C-terminal 13 bp of IC3 from 5-HT2C and the C-terminal of 5-HT2A starting at beginning of TM6, was amplified by using the following primers:

5'-AAAAGCTTCGAAAGTGCTGGGCATCGTCTTCTTCCT-3' (SEQ.ID.NO:10)

5'-TGCTCTAGATTCCAGATAGGTGAAAAC TTG-3' (SEQ.ID.NO: 11)

20 The template used was human 5-HT2A cDNA.

Second round PCR was performed using Fragment A and Fragment B as co-templates with SEQ.ID.NO:8 and SEQ.ID.NO:11 (it is noted that the sequences for SEQ.ID.NOS.: 6 and 11 are the same) as primers. The resulting 740 bp PCR fragment, Fragment C, contained the IC3 loop of human 5-HT2C fused to TM6 through the end of the cytoplasmic tail of human 5-HT2A. PCR was performed using pfu<sup>TM</sup> polymerase (Stratagene) with the buffer system provided by the manufacturer, and 10% DMSO, 0.25 mM of each primer, and 0.5 mM of each of the four (4) nucleotides. The cycle conditions were 25 cycles of 94 °C for 1 minute, 57 °C (1st round PCR) or 60 °C (2nd round PCR) for 1 minute, and 72 °C for 1 minute (1st round PCR) or 90 seconds. (2nd round PCR).

30 To generate a PCR fragment containing a fusion junction between the human 5-HT2A TM5 and the IC3 loop of 5-HT2C, four (4) primers were used. The two external primers, derived from human 5-HT2A, had the following sequences:

5'-CGTGTCTCTCCTTACTTCA-3' (SEQ.ID.NO:12)

The other primer used was SEQ.ID.NO.6 (see note above regarding SEQ.ID.NOS. 6 and 11). The first internal primer utilized was an antisense strand containing the initial 13 bp of IC3 of 5-HT2C followed by the terminal 23 bp derived from TM5 of 5-HT2A:

5'-TCGGCGCAGTACTTGATAGTTAGAAAGTAGGTGAT-3' (SEQ.ID.NO:13)

5 The second internal primer was a sense strand containing the terminal 14 bp derived from TM5 of 5-HT2A followed by the initial 24 bp derived from IC3 of 5-HT2C:

5'-TTCTAACTATCAAAGTACTGCGCCACAAGCTTGATG-3'

(SEQ.ID.NO:14).

PCR was performed using endogenous human 5-HT2A and a co-template, Fragment C, in a 50 ml reaction volume containing 1X pfu buffer, 10% DMSO, 0.5 mM of each of the four (4) nucleotides, 0.25 mM of each external primer (SEQ.ID.NOS. 11 and 12), 0.06 mM of each internal primer (SEQ.ID.NOS. 13 and 14) and 1.9 units of pfu polymerase (Stratagene). The cycle conditions were 25 cycles of 94°C for 1 minute, 52°C for 1 minute and 72 °C for 2 minutes and 10 seconds. The 1.3 kb PCR product was then gel purified and digested with Pst I and Eco RI. The resulting 1 kb PstI-Eco RI fragment was used to replace the corresponding fragment in the endogenous human 5-HT2A sequence to generate the mutant 5-HT2A sequence encoding the IC3 loop of 5-HT2C.

*(b) Replacement of the cytoplasmic tail*

To replace the cytoplasmic tail of 5-HT2A with that of 5-HT2C, PCR was performed using a sense primer containing the C-terminal 22 bp of TM7 of endogenous human 5-HT2A followed by the initial 21 bp of the cytoplasmic tail of endogenous human 5-HT2C:

5'-TTCAGCAGTCAACCCACTAGTCTATACTCTGTTCAACAAAATT-3'

(SEQ.ID.NO:15)

25 The antisense primer was derived from the 3' untranslated region of endogenous human 5-HT2C:

5'-ATTCTAGACATATGTAGCTTGTACCGT-3' (SEQ.ID.NO:16).

The resulting PCR fragment, Fragment D, contained the last 22 bp of endogenous human 5-HT2A TM7 fused to the cytoplasmic tail of endogenous human 5-HT2C. Second round PCR was performed using Fragment D and the co-template was endogenous human 5-HT2A that was previously digested with Acc I to avoid undesired amplification. The antisense primer used was SEQ.ID.NO:16 (the sequences for SEQ.ID.NOS. 16 and 2 are the same) and the sense primer used was derived from endogenous human 5-HT2A:

5'-ATCACCTACTTCTAACTA-3' (SEQ.ID.NO:17).

PCR conditions were as set forth in Example 1B3.(a) for the first round PCR, except that the annealing temperature was 48 °C and the extension time was 90 seconds. The resulting 710 bp PCR product was digested with Apa I and Xba I and used to replace the corresponding Apa I-Xba I fragment of either (a) endogenous human 5-HT2A, or (b) 5-HT2A with 2C IC3 to generate (a) endogenous human 5-HT2A with endogenous human 5-HT2C cytoplasmic tail and (b) AP-3, respectively.

#### 4. AP-4 cDNA

This mutant was created by replacement of the region of endogenous human 5-HT2A from amino acid 247, the middle of TM5 right after Pro<sup>246</sup>, to amino acid 337, the middle of TM6 just before Pro<sup>338</sup>, by the corresponding region of AP-1 cDNA. For convenience, the junction in TM5 is referred to as the "2A-2C junction," and the junction in TM6 is referred to as the "2C-2A junction."

Three PCR fragments containing the desired hybrid junctions were generated. The 5' fragment of 561 bp containing the 2A-2C junction in TM5 was generated by PCR using endogenous human 5-HT2A as template, SEQ.ID.NO:12 as the sense primer, and the antisense primer was derived from 13 bp of 5-HT2C followed by 20 bp of 5-HT2A sequence:

5'-CCATAATCGTCAGGGGAATGAAAAATGACACAA-3' (SEQ.ID.NO:18)

The middle fragment of the 323 bp contains endogenous human 5-HT2C sequence derived from the middle of TM5 to the middle of TM6, flanked by 13 bp of 5-HT2A sequences from the 2A-2C junction and the 2C-2A junction. This middle fragment was generated by using AP-1 cDNA as a template, a sense primer containing 13 bp of 5-HT2A followed by 20 bp of 5-HT2C sequences across the 2A-2C junction and having the sequence:

5'-ATTTTCATTCCCTGACGATTATGGTGATTAC-3' (SEQ.ID.NO:19);

and an antisense primer containing 13 bp of 5-HT2A followed by 20 bp of 5-HT2C sequences across the 2C-2A junction and having the sequence:

5'-TGATGAAGAAAGGGCACCATGATCAGAAACA-3' (SEQ.ID.NO:20).

The 3' fragment of 487 bp containing the 2C-2A junction was generated by PCR using endogenous human 5-HT2A as a template and a sense primer having the following sequence from the 2C-2A junction:

5'-GATCATGTGGTGCCTTCTTCATCACAAACAT-3' (SEQ.ID.NO:21)  
and the antisense primer was SEQ.ID.NO:6 see note above regarding SEQ.ID.NOS. 6 and  
11).

Two second round PCR reactions were performed separately to link the 5' and  
5 middle fragment (5'M PCR) and the middle and 3' fragment (M3' PCR). The 5'M PCR co-  
template used was the 5' and middle PCR fragment as described above, the sense primer  
was SEQ.ID.NO:12 and the antisense primer was SEQ.ID.NO:20. The 5'M PCR procedure  
resulted in an 857 bp PCR fragment.

The M3' PCR used the middle and M3' PCR fragment described above as the co-  
10 template, SEQ.ID.NO: 19 as the sense primer and SEQ.ID.NO:6 (see note above regarding  
SEQ.ID.NOS. 6 and 11) as the antisense primer, and generated a 784 bp amplification  
product. The final round of PCR was performed using the 857 bp and 784 bp fragments  
from the second round PCR as the co-template, and SEQ.ID.NO:12 and SEQ.ID.NO: 6 (see  
note above regarding SEQ.ID.NOS. 6 and 11) as the sense and the antisense primer,  
15 respectively. The 1.32 kb amplification product from the final round of PCR was digested  
with Pst I and Eco RI. Then resulting 1 kb Pst I-Eco RI fragment was used to replace the  
corresponding fragment of the endogenous human 5-HT2A to generate mutant 5-HT2A  
with 5-HT2C: C310K/IC3. The Apa I-Xba fragment of AP3 was used to replace the  
corresponding fragment in mutant 5-HT2A with 5-HT2C: C310K/IC3 to generate AP4.

20

### Example 2

#### RECEPTOR EXPRESSION

##### A. pCMV

Although a variety of expression vectors are available to those in the art, for  
25 purposes of utilization for both the endogenous and non-endogenous receptors discussed  
herein, it is most preferred that the vector utilized be pCMV. This vector was deposited  
with the American Type Culture Collection (ATCC) on October 13, 1998 (10801 University  
Blvd., Manassas, VA 20110-2209 USA) under the provisions of the Budapest Treaty for the  
International Recognition of the Deposit of Microorganisms for the Purpose of Patent  
30 Procedure. The DNA was tested by the ATCC and determined to be viable. The ATCC has  
assigned the following deposit number to pCMV: ATCC #203351. See Figure 8.

##### B. Transfection procedure

For the generic assay ( $[^{35}\text{S}]\text{GTP}\gamma\text{S}$ ; Example 3) and the antagonist binding assay (mesulergine; Example 4), transfection of COS-7 or 293T cells was accomplished using the following protocol.

On day one,  $5\times 10^6$  COS-7 cells or  $1\times 10^7$  293T cells per 150mm plate were plated out.

5 On day two, two reaction tubes were prepared (the proportions to follow for each tube are per plate): tube A was prepared by mixing 20 $\mu\text{g}$  DNA (e.g., pCMV vector; pCMV vector AP-1 cDNA, etc.) in 1.2ml serum free DMEM (Irvine Scientific, Irvine, CA); tube B was prepared by mixing 120 $\mu\text{l}$  lipofectamine (Gibco BRL) in 1.2ml serum free DMEM. Tubes A and B were then admixed by inversions (several times), followed by incubation at room temperature  
10 for 30-45min. The admixture is referred to as the "transfection mixture". Plated COS-7 cells were washed with 1X PBS, followed by addition of 10ml serum free DMEM. 2.4ml of the transfection mixture was then added to the cells, followed by incubation for 4hrs at 37°C/5% CO<sub>2</sub>. The transfection mixture was then removed by aspiration, followed by the addition of 25ml of DMEM/10% Fetal Bovine Serum. Cells were then incubated at 37°C/5% CO<sub>2</sub>. After  
15 72hr incubation, cells were then harvested and utilized for analysis.

### Example 3

#### GTP MEMBRANE BINDING SCINTILLATION PROXIMITY ASSAY

20 The advantages of using  $[^{35}\text{S}]\text{GTP}\gamma\text{S}$  binding to measure constitutive activation are that: (a)  $[^{35}\text{S}]\text{GTP}\gamma\text{S}$  binding is generically applicable to all G protein-coupled receptors; and (b)  $[^{35}\text{S}]\text{GTP}\gamma\text{S}$  binding is proximal at the membrane surface, thereby making it less likely to pick-up molecules which affect the intracellular cascade. The assay utilizes the ability of G protein-coupled receptors to stimulate  $[^{35}\text{S}]\text{GTP}\gamma\text{S}$  binding to membranes expressing the relevant receptors. Therefore, the assay may be used to directly screen compounds at the disclosed serotonin receptors.

Figure 9 demonstrates the utility of a scintillation proximity assay to monitor the binding of  $[^{35}\text{S}]\text{GTP}\gamma\text{S}$  to membranes expressing the endogenous human 5-HT<sub>2C</sub> receptor expressed in COS cells. In brief, the assay was incubated in 20 mM HEPES, pH 7.4, binding buffer with 0.3 nM  $[^{35}\text{S}]\text{GTP}\gamma\text{S}$  and 12.5  $\mu\text{g}$  membrane protein and 1  $\mu\text{M}$  GDP for 30 minutes. Wheatgerm agglutinin beads (25  $\mu\text{l}$ ; Amersham) were then added and the mixture was incubated for another 30 minutes at room temperature. The tubes were then centrifuged at 1500

x g for 5 minutes at room temperature and then counted in a scintillation counter. As shown in Figure 9, serotonin, which as the endogenous ligand activates the 5-HT2C receptor, stimulated [<sup>35</sup>S]GTP $\gamma$ S binding to the membranes in a concentration dependant manner. The stimulated binding was completely inhibited by 30  $\mu$ M mianserin, a compound considered as a classical 5-HT2C antagonist, but also known as a 5-HT2C inverse agonist.

Although this assay measures agonist-induced binding of [<sup>35</sup>S]GTP $\gamma$ S to membranes and can be routinely used to measure constitutive activity of receptors, the present cost of wheatgerm agglutinin beads may be prohibitive. A less costly but equally applicable alternative also meets the needs of large-scale screening. Flash plates and Wallac<sup>TM</sup> scintistrips 10 may be used to format a high throughput [<sup>35</sup>S]GTP $\gamma$ S binding assay. This technique allows one to monitor the tritiated ligand binding to the receptor while simultaneously monitoring the efficacy via [<sup>35</sup>S]GTP $\gamma$ S binding. This is possible because the Wallac<sup>TM</sup> beta counter can switch energy windows to analyze both tritium and <sup>35</sup>S-labeled probes.

Also, this assay may be used for detecting of other types of membrane activation 15 events that result in receptor activation. For example, the assay may be used to monitor <sup>32</sup>P phosphorylation of a variety of receptors (including G protein-coupled and tyrosine kinase receptors). When the membranes are centrifuged to the bottom of the well, the bound [<sup>35</sup>S]GTP $\gamma$ S or the <sup>32</sup>P-phosphorylated receptor will activate the scintillant coated on the wells. Use of Scinti<sup>®</sup> strips (Wallac<sup>TM</sup>) demonstrate this principle. Additionally, this assay may be 20 used for measuring ligand binding to receptors using radiolabeled ligands. In a similar manner, the radiolabeled bound ligand is centrifuged to the bottom of the well and activates the scintillant. The [<sup>35</sup>S]GTP $\gamma$ S assay results parallel the results obtained in traditional second messenger assays of receptors.

As shown in Figure 10, serotonin stimulates the binding of [<sup>35</sup>S]GTP $\gamma$ S to the 25 endogenous human 5-HT2C receptor, while mianserin inhibits this response. Furthermore, mianserin acts as a partial inverse agonist by inhibiting the basal constitutive binding of [<sup>35</sup>S]GTP $\gamma$ S to membranes expressing the endogenous human 5-HT2C receptor. As expected, there is no agonist response in the absence of GDP since there is no GDP present to exchange for [<sup>35</sup>S]GTP $\gamma$ S . Not only does this assay system demonstrate 30 the response of the native 5-HT2C receptor, but it also measures the constitutive activation of other receptors.

Figure 11A and Figure 11B demonstrate the enhanced binding of [<sup>35</sup>S]GTP $\gamma$ S to membranes prepared from 293T cells expressing the control vector alone, the native human 5-HT2C receptor or the AP-1 receptor. The total protein concentration used in the assay affects the total amount of [<sup>35</sup>S]GTP $\gamma$ S binding for each receptor. The c.p.m. differential between the CMV transfected and the constitutively active mutant receptor increased from approximately 1000 c.p.m at 10  $\mu$ g/well to approximately 6-8000 c.p.m. at 75  $\mu$ g/well protein concentration, as shown in Figure 11.

The AP-1 receptor showed the highest level of constitutive activation followed by the wild type receptor, which also showed enhanced [<sup>35</sup>S]GTP $\gamma$ S binding above basal. This is consistent with the ability of the endogenous human 5-HT2C receptor to accumulate intracellular IP<sub>3</sub> in the absence of 5HT stimulation (Example 5) and is also consistent with published data claiming that the endogenous human 5-HT2C receptor has a high natural basal activity. Therefore, the AP-1 receptor demonstrates that constitutive activity may be measured by proximal [<sup>35</sup>S]GTP $\gamma$ S binding events at the membrane interface.

15

#### Example 4

##### **SEROTONIN RECEPTOR AGONIST/ANTAGONIST COMPETITIVE BINDING ASSAY**

Membranes were prepared from transfected COS-7 cells (see Example 2) by homogenization in 20 mM HEPES and 10 mM EDTA, pH 7.4 and centrifuged at 49,000 x g for 15 min. The pellet was resuspended in 20 mM HEPES and 0.1 mM EDTA, pH 7.4, 20 homogenized for 10 sec. using polytron homogenizer (Brinkman) at 5000 rpm and centrifuged at 49,000 x g for 15 min. The final pellet was resuspended in 20 mM HEPES and 10 mM MgCl<sub>2</sub>, pH 7.4, homogenized for 10 sec. using polytron homogenizer (Brinkman) at 5000 rpm.

Assays were performed in triplicate 200 $\mu$ l volumes in 96 well plates. Assay buffer (20 mM HEPES and 10 mM MgCl<sub>2</sub>, pH 7.4) was used to dilute membranes, <sup>3</sup>H-LSD, <sup>3</sup>H-mesulergine, serotonin (used to define non-specific for LSD binding) and mianserin (used to define non-specific for mesulergine binding). Final assay concentrations consisted of 1nM <sup>3</sup>H-LSD or 1nM <sup>3</sup>H-mesulergine, 50 $\mu$ g membrane protein and 100 $\mu$ m serotonin or mianserin. LSD assays were incubated for 1 hr at 37° C, while mesulergine assays were incubated for 1 hr at room temperature. Assays were terminated by rapid filtration onto Wallac Filtermat Type B with ice cold binding buffer using Skatron cell harvester. The radioactivity was determined in a Wallac 1205 BetaPlate counter.

**Example 5****INTRACELLULAR IP<sub>3</sub> ACCUMULATION ASSAY**

5 For the IP<sub>3</sub> accumulation assay, a transfection protocol different from the protocol set forth in Example 2 was utilized. In the following example, the protocols used for days 1-3 were slightly different for the data generated for Figures 12 and 14 and for Figures 13 and 15; the protocol for day 4 was the same for all conditions.

**A. COS-7 and 293 Cells**

10 On day one, COS-7 cells or 293 cells were plated onto 24 well plates, usually  $1 \times 10^5$  cells/well or  $2 \times 10^5$  cells/well, respectively. On day two, the cells were transfected by first mixing 0.25 µg DNA (*see Example 2*) in 50 µl serum-free DMEM/well and then 2 µl lipofectamine in 50 µl serum-free DMEM/well. The solutions ("transfection media") were gently mixed and incubated for 15-30 minutes at room temperature. The cells were washed  
15 with 0.5 ml PBS and then 400 µl of serum free media was mixed with the transfection media and added to the cells. The cells were then incubated for 3-4 hours at 37°C/5%CO<sub>2</sub>. Then the transfection media was removed and replaced with 1ml/well of regular growth media. On day 3, the media was removed and the cells were washed with 0.5 ml PBS. Then  
20 0.5 ml inositol-free/serum-free media (GIBCO BRL) was added to each well with 0.25 µCi of <sup>3</sup>H-myo-inositol/well and the cells were incubated for 16-18 hours overnight at 37°C/5%CO<sub>2</sub>. Protocol A.

**B. 293 Cells**

On day one,  $1 \times 10^7$  293 cells per 150mm plate were plated out. On day two, two reaction tubes were prepared (the proportions to follow for each tube are per plate): tube A was prepared by mixing 20µg DNA (e.g., pCMV vector; pCMV vector AP-1 cDNA, etc.) in 1.2ml serum free DMEM (Irvine Scientific, Irvine, CA); tube B was prepared by mixing 120µl lipofectamine (Gibco BRL) in 1.2ml serum free DMEM. Tubes A and B were then admixed by inversions (several times), followed by incubation at room temperature for 30-45min. The admixture is referred to as the "transfection mixture". Plated 293 cells were washed with  
25 1XPBS, followed by addition of 10ml serum free DMEM. 2.4ml of the transfection mixture was then added to the cells, followed by incubation for 4hrs at 37°C/5% CO<sub>2</sub>. On day 3, cells were trypsinized and counted, followed by plating of  $1 \times 10^6$  cells/well (poly D-lysine treated  
30

12-well plates). Cells were permitted to adhere to the wells, followed by one wash with 1xPBS. Thereafter, 0.5  $\mu$ Ci  $^3$ H-inositol in 1ml inositol-free DMEM was added per well. Protocol B.

On day 4, the cells were washed with 0.5 ml PBS and then 0.45 ml of assay medium  
5 was added containing inositol-free/serum free media, 10  $\mu$ M pargyline, 10 mM lithium chloride, or 0.4 ml of assay medium and 50  $\mu$ l of 10x ketanserin (ket) to a final concentration of 10 $\mu$ M. The cells were then incubated for 30 minutes at 37°C. Then the cells were washed with 0.5 ml PBS and 200  $\mu$ l of fresh/icecold stop solution (1M KOH; 18 mM Na-borate; 3.8 mM EDTA) was added/well. The solution was kept on ice for 5-10  
10 minutes or until the cells were lysed and then neutralized by 200  $\mu$ l of fresh/ice cold neutralization sol. (7.5 % HCL). The lysate was then transferred into 1.5 ml microcentrifuge tubes and 1 ml of chloroform/methanol (1:2) was added/tube. The solution was vortexed for 15 seconds and the upper phase was applied to a Biorad AG1-X8 anion exchange resin ( 100-200 mesh). The resin was washed with water and 0.9 ml of the upper  
15 phase was loaded onto the column. The column was washed with 10 mls of 5 mM myo-inositol and 10 ml of 5 mM Na-borate/60mM Na-formate. The inositol trisphosphates were eluted into scintillation vials containing 10 ml of scintillation cocktail with 2 ml of 0.1 M formic acid/ 1 M ammonium formate. The columns were regenerated by washing with 10 ml of 0.1 M formic acid/3M ammonium formate and rinsed twice with dd H<sub>2</sub>O and stored at  
20 room temperature in water. Results are discussed below.

Figure 12 is an illustration of IP3 production from the human 5-HT2A receptor which was mutated using the same point mutation as set forth in Casey, which rendered the rat receptor constitutively active. The results represented in Figure 12, support the position that when the point mutation shown to activate the rat receptor is introduced into the human receptor, little activation of the receptor is obtained that would allow for appropriate screening of candidate compounds, with the response being only moderately above that of the endogenous human 5-HT2A receptor. Generally, a response of at least 2X above that of the endogenous response is preferred.  
25

Figure 13 provides an illustration comparing IP3 production from endogenous 5-HT2A receptor and the AP4 mutation. The results illustrated in Figure 13 support the position that when the novel mutation disclosed herein is utilized, a robust response of constitutive IP3 accumulation is obtained (e.g., over 2X that of the endogenous receptor).  
30

Figure 14 provides an illustration of IP<sub>3</sub> production from AP3. The results illustrated in Figure 14 support the position that when the novel mutation disclosed herein is utilized, a robust response of constitutive IP<sub>3</sub> accumulation is obtained.

Figure 15 provides bar-graph comparisons of IP<sub>3</sub> accumulation between endogenous 5 human 5-HT<sub>2C</sub> receptor and AP-1. Note that the endogenous receptor has a high degree of natural constitutive activity relative to the control CMV transfected cells (i.e., the endogenous receptor appears to be constitutively activated).

#### **Example 6**

10      **SCREENING OF COMPOUNDS KNOWN TO HAVE 5-HT<sub>2C</sub> ANTAGONIST ACTIVITY AGAINST  
NON-ENDOGENOUS, CONSTITUTIVELY ACTIVATED  
HUMAN SEROTONIN RECEPTOR: AP-1**

A final concentration of 12.5 µg membranes prepared from COS7 cells (see 15 Example 2) transiently expressing constitutively active mutant human 5HT<sub>2C</sub> receptor AP-1 were incubated with binding buffer (20 mM HEPES, pH 7.4, 100 mM NaCl, 20 mM MgCl<sub>2</sub>.6H<sub>2</sub>O, 0.2% saponin, and 0.2 mM ascobate), GDP(1µM) and compound in a 96-well plate format for a period of 60 minutes at ambient room temperature. Plates were then centrifuged at 4,000 rpm for 15 minutes followed by aspiration of the reaction mixture and 20 counting for 1 minute in a Wallac™ MicroBeta plate scintillation counter. A series of compounds known to possess reported 5HT<sub>2C</sub> antagonist activity were determined to be active in the [<sup>35</sup>S]GTPγS binding assay using AP-1. IC<sub>50</sub> determinations were made for these commercially available compounds (RBI, Natick, MA). Results are summarized in Table 3. For each determination, eight concentrations of test compounds were tested in 25 triplicate. The negative control in these experiments consisted of AP-1 receptor without test compound addition, and the positive control consisted of 12.5 µg/well of COS7 cell membranes expressing the CMV promoter without expressed AP-1 receptor.

---

**TABLE 3**

<b>Test Compound</b>	<b>Known Pharmacology</b>	<b>IC<sub>50</sub> (nM) in GTP-γ-[<sup>35</sup>S] Assay</b>
Metergoline	SHT2/1C antagonist	32.0

Mesulergine	5HT2/1C antagonist	21.2
Methysergide	5HT2/1C antagonist	6.1
Methiothepin	5HT1 antagonist	20.4
Normethylclozapin	5HT2/1C antagonist	21.4
Fluoxetine	5HT reuptake inhibitor	114.0
Ritanserin	5HT2/1C antagonist	19.4

The IC<sub>50</sub> results confirm that the seven tested compounds showed antagonist activity at the AP-1 receptor.

#### **Example 7**

5      **SCREENING OF CANDIDATE COMPOUNDS AGAINST NON-ENDOGENOUS,  
CONSTITUTIVELY ACTIVATED HUMAN SEROTONIN RECEPTORS:AP-1**

Approximately 5,500 candidate compounds (Tripos, Inc., St. Louis, MO) were screened using the assay protocol of Example 3 (with AP-1 mutant receptor) for identification as inverse agonists against the receptor; for this assay, an arbitrary cut-off of at least 50% inhibition was established for identification of inverse agonists. Approximately 120 of these compounds evidenced at least 50% inhibition of [<sup>35</sup>S]GTPγS binding at 10 μM candidate compound (data not shown).

#### **Example 8**

15     **SCREENING OF SELECTED COMPOUNDS TO CONFIRM RECEPTOR  
BINDING: AP-1**

The candidate compounds identified from Example 7 were then screened using the assay protocol of Example 4 (mesulergine), using the AP-1 mutant receptor. IC<sub>50</sub> (nM) values were determined; five of the nearly 120 compounds of Example 7 were determined to have potent binding affinity for the receptor. Results are summarized in Table 4.

**Table 4**

<b>Candidate Compound</b>	<b>IC<sub>50</sub> (nM) in Mesulergine Assay</b>
102461	205.0
102788	46.5
100341	209.0
100431	147.0
103487	1,810.0

**Example 9a****GENERAL SCREENING PARADIGM:****SELECTION OF PRE-CLINICAL CANDIDATE LEADS**

The "primary" screen designed to directly identify human 5HT<sub>2A</sub>/5HT<sub>2C</sub> receptor inverse agonists consisted of a membrane-based GTPγS binding assay utilizing membranes prepared from COS7 cells transiently transfected with AP-1 human receptor. Candidate compounds (10μM final assay concentration) directly identified as inhibiting receptor-mediated increases in GTPγS binding by greater than 50-75% (arbitrary cut-off value) were considered active "hits". Primary assay hits were then re-tested in the same assay to reconfirm their inverse agonist activity. If primary assay hits were reconfirmed active (50% or greater inhibition), and therefore directly identified as, e.g., an inverse agonist, one of two approaches were available: (a) so-called "directed libraries" could be created, i.e., additional candidate compounds were synthesized based upon the structures of the reconfirmed hits (geared towards, e.g., improvement in the characteristics of the compounds) whereby the directed library compounds were then evaluated for the ability to compete for radioligand binding to both mutant 5HT2C (AP-1) and endogenous 5HT2A receptors, or (b) the reconfirmed hits were then evaluated for the ability to compete for radioligand binding to both mutant 5HT2C (AP-1) and endogenous 5HT2A receptors. Thus, when approach (a) was used, because these directed library candidate compounds were based upon the structures of compounds that were directly identified from the

membrane-based GTP $\gamma$ S binding assay, the directed library compounds were not re-tested in the membrane-based GTP $\gamma$ S binding assay but rather were then confirmed via the radioligand binding analysis. The radioligand binding analysis tests were initially performed at 10 $\mu$ M test compound in triplicate and if the compound inhibited radiolabeled binding by 5 50% or more, the analysis was followed by eight concentration competition curves to determine Ki values. The last step in secondary assay evaluation was to determine if test compounds were capable of inhibiting AP-3 receptor-mediated accumulation of inositol phosphates (e.g., IP<sub>3</sub>). This final assay confirms that the directly identified compounds retained inverse agonist properties.

10

**Example 9b****CONSTITUTIVELY ACTIVATED HUMAN 5HT2C RECEPTOR (AP-1)  
MEDIATED FACILITATION OF GTP $\gamma$ S BINDING TO COS7 MEMBRANES**

15

This protocol is substantially the same as set forth above in Example 6.

Primary screening assays measuring GTP $\gamma$ S binding to membranes prepared from COS7 cells transiently transfected with human mutated 5HT2C receptor (AP-1) were used to directly identify inverse agonists in screening libraries (Tripos, Inc.). Candidate compound screens were performed in a total assay volume of 200 $\mu$ l using scintillant-coated 20 Wallac Scintistrip™ plates. The primary assay was comprised of the following chemicals (at indicated final assay concentrations): 20 mM HEPES, pH 7.4, 100 mM NaCl, 20 mM MgCl<sub>2</sub>, 0.2% saponin, 0.2 mM ascorbic acid, 1 $\mu$ M GDP, 0.3 nM GTP $\gamma$ <sup>35</sup>S, and 12.5  $\mu$ g of the above defined membranes. Incubations were performed for 60 minutes at ambient room 25 temperature. The binding assay incubation was terminated by centrifugation of assay plates at 4,000 rpm for 15 minutes, followed by rapid aspiration of the reaction mixture and counting in a Wallac MicroBeta™ scintillation counter.

Primary screening of candidate compounds initially involved testing of 72 test compounds per assay plate (96-well plates were utilized), at a final assay concentration of 10 $\mu$ M candidate compound, in single replicates. A total of sixteen wells of each plate were 30 dedicated for an eight concentration clozapine (a confirmed 5HT2C/2A inverse agonist) dose response curve (duplicate determinations at each concentration). Finally, a total of five assay wells of each plate were dedicated to define the negative control (AP-1 receptor

expressing membranes without addition of candidate compounds) and three wells from each plate to define the positive control (membranes without AP-1 receptor).

Reconfirmation experiments involve re-testing candidate compounds in the same assay described above, except that candidate compounds were evaluated in triplicate, thus allowing evaluation of 24 compounds per 96-well assay plate. Similar to the primary assay plates, an eight concentration clozapine dose response curve (duplicate determinations at each concentration) and the same negative and positive control wells were also included within each 96-well plate.

10

**Example 9c(1)****COMPETITION STUDIES  
MUTATED HUMAN 5HT2C RECEPTOR (AP-1)**

15 Radioligand binding competition experiments were performed in a total assay volume of 200 $\mu$ l using standard 96-well microtiter plates. The final assay ingredients consisted of assay buffer (20mM HEPES and 10mM MgCl<sub>2</sub>), 1nM [<sup>3</sup>H]mesulergine, and 50 $\mu$ g of membranes (COS7 with AP-1 as defined above). Nonspecific [<sup>3</sup>H]mesulergine binding was defined in the presence of 100 $\mu$ M mianserin. Incubations were performed for 1 hour at 37°C.  
20 Receptor bound radioligand was resolved from free radioligand by rapid filtration of the assay mixture over a Wallac Filtermat™ Type B filter, followed by washing with ice-cold assay buffer using a Skatron™ cell harvester. Radioactivity was counted using a Wallac 1205 BetaPlate™ counter. Each assay plate contained five negative control wells (membranes expressing receptor and no candidate compound addition) and three positive control wells  
25 (each containing 100 $\mu$ M mianserin). For one concentration tests, candidate compounds were diluted into assay buffer and screened at a final concentration of 10 $\mu$ M, in triplicate. For IC<sub>50</sub> determinations, candidate compounds were diluted in assay buffer and eight different concentrations were evaluated, in triplicate. A total of 16 wells were designated for an eight concentration mianserin dose response curve evaluation for both assays.

30

**Example 9c(2)****COMPETITION STUDIES**

**WILD TYPE HUMAN 5HT2A RECEPTOR**

Radioligand binding competition experiments were performed in a total assay volume of 200 $\mu$ l using standard 96-well microtiter plates. The final assay ingredients comprised assay buffer (20mM HEPES and 10mM MgCl<sub>2</sub>), 1nM [<sup>3</sup>H]LSD, and 50 $\mu$ g of the above-defined membranes (COS7 with AP-1). Nonspecific [<sup>3</sup>H]LSD binding was defined in the presence of 100 $\mu$ M serotonin. Incubations were performed for 1 hour at 37°C. Receptor bound radioligand was resolved from free radioligand by rapid filtration of the assay mixture over a Wallac Filtermat™ Type B filter, followed by washing with ice-cold assay buffer using a Skatron™ cell harvester. Radioactivity was counted using a Wallac 1205 BetaPlate™ counter. Each assay plate contained five negative control wells (membranes expressing receptor and no candidate compound addition) and three positive control wells (containing 100 $\mu$ M mianserin). For one concentration tests, candidate compounds were diluted into assay buffer and screened at a final concentration of 10 $\mu$ M in triplicate. For IC<sub>50</sub> determinations, candidate compounds were diluted in assay buffer and eight different concentrations were evaluated in triplicate. A total of 16 wells were designated for an eight concentration serotonin dose response curve evaluation for both assays.

**Example 9d****20 RECEPTOR-MEDIATED INOSITOL PHOSPHATE ACCUMULATION**

Candidate compound identified in the assays of Examples 9a-9c were then evaluated for inositol phosphate accumulation, following the protocol of Example 5 (COS7 cells expressing human mutated 5HT2A receptor, AP-3), modified as follows: tube A was prepared by mixing 16  $\mu$ g DNA (e.g., pCMV vector; pCMV vector AP-1 cDNA, etc.) in 1.0ml serum free DMEM (Irvine Scientific, Irvine, CA); tube B was prepared by mixing 60 $\mu$ l lipofectamine (Gibco BRL) in 1.0 ml serum free DMEM. Tubes A and B were then admixed by inversions (several times), followed by incubation at room temperature for 30 min. The admixture is referred to as the "transfection mixture". Plated 293 cells were washed with 10 ml Serum Free DMEM, followed by addition of 11 ml Serum Free DMEM. 2.0 ml of the transfection mixture was then added to the cells, followed by incubation for 5hrs at 37°C/5% CO<sub>2</sub>. On day 3, cells were trypsinized and counted, followed by plating of 1x10<sup>6</sup> cells/well

(12-well plates). Cells were permitted to adhere to the wells for 8 hrs., followed by one wash with 1x PBS. Thereafter, 0.5  $\mu$ Ci  $^3$ H-inositol in 1 ml inositol-free DMEM was added per well.

On day 4, the cells were washed with 1.5 ml PBS and then 0.9 ml of assay medium was added containing inositol-free/serum free media, 10  $\mu$ M pargyline, 10 mM lithium chloride, for 5 min in 37°C/5% CO<sub>2</sub> followed by 100  $\mu$ l addition of candidate compound diluted in the same material. The cells were then incubated for 120 minutes at 37°C. Then the cells were washed with 1.5 ml PBS and 200  $\mu$ l of fresh/icecold stop solution (1M KOH; 18 mM Na-borate; 3.8 mM EDTA) was added/well. The solution was kept on ice for 5-10 minutes or until the cells were lysed and then neutralized by 200  $\mu$ l of fresh/ice cold neutralization sol. (7.5 % HCL). The lysate was then transferred into 1.5 ml microcentrifuge tubes and 1 ml of chloroform/methanol (1:2) was added/tube. The solution was vortexed for 15 seconds and the upper phase was applied to a Biorad AG1-X8 anion exchange resin ( 100-200 mesh). The resin was washed with water and 0.9 ml of the upper phase was loaded onto the column. The column was washed with 10 mls of 5 mM myo-inositol and 10 ml of 5 mM Na-borate/60mM Na-formate. The inositol triphosphates were eluted into scintillation vials containing 10 ml of scintillation cocktail with 2 ml of 0.1 M formic acid/ 1 M ammonium formate. The columns were regenerated by washing with 10 ml of 0.1 M formic acid/3M ammonium formate and rinsed twice with dd H<sub>2</sub>O and stored at room temperature in water.

Following this round of assaying, candidate compounds having an IC<sub>50</sub> value of less than 10 $\mu$ M were considered as potential leads for the development of pharmaceutical compositions.

### SCREENING CANDIDATE COMPOUNDS

Following the protocols set forth above, one compound, 103487 (Example 8, *supra*) evidenced the following results:

Figure Number	GTP $\gamma$ S AP-1 Percent Inhibition Relative	GTP $\gamma$ S AP-1 Percent Inhibition Relative To	Competitive Binding AP-1 ( $[^3$ H]mesulergine)	Competitive Binding WT 5HT2A ( $[^3$ H]LSD)	Inositol Phosphate Accumulation AP-3
---------------	---	--	--	--	--------------------------------------

	To Positive Control (Primary)	Positive Control (Reconfirm)	IC <sub>50</sub> Value (nM)	IC <sub>50</sub> Value (nM)	IC <sub>50</sub> Value (nM)
15A (103487)	-1%	31%	2100 850	46	52 90

Based upon these results, structure activity analysis of the 103487 compound suggested that a series of derivatives of 3-(4-bromo-1-methylpyrazole-3-yl)phenylamine would exhibit similar 5-HT<sub>2A</sub> activity and selectivity. A series of derivatives of 3-(4-bromo-1-methylpyrazole-3-yl)phenylamine have now been synthesized. These "directed" library compounds (Tripos, Inc.) were then analyzed in accordance with the protocols of Examples 9c(1), 9c(2) and 9d.

This series of compounds exhibits highly selective 5-HT<sub>2A</sub> activity. Accordingly, in the first aspect of the invention, a series of compounds possessing 5-HT<sub>2A</sub> receptor activity that are useful as inverse agonists at such receptors is designated by the general formula (A):

(A)

Wherein:

W is lower alkyl (C<sub>1-6</sub>), or halogen;

V is lower alkyl (C<sub>1-6</sub>), or halogen;

X is either Oxygen or Sulfur;

Y is NR<sup>2</sup>R<sup>3</sup>, or (CH<sub>2</sub>)<sub>m</sub>R<sup>4</sup>, or O(CH<sub>2</sub>)<sub>n</sub>R<sup>4</sup>;

m = 0 - 4

n = 0 - 4

5 R<sup>1</sup> is H or lower alkyl (C<sub>1-4</sub>);

R<sup>2</sup> is H or lower alkyl(C<sub>1-4</sub>);

10 R<sup>3</sup> and R<sup>4</sup> are independently a C<sub>1-6</sub> alkyl, or C<sub>2-6</sub> alkenyl, or cycloalkyl, or aryl group and each said group may be optionally substituted by up to four substituents in any position independently selected from CF<sub>3</sub>, CCl<sub>3</sub>, Me, NO<sub>2</sub>, OH, OMe, OEt, CONR<sup>5</sup>R<sup>6</sup>, NR<sup>5</sup>R<sup>6</sup>, OCF<sub>3</sub>, SMe, COOR<sup>7</sup>, SO<sub>2</sub>NR<sup>5</sup>R<sup>6</sup>, SO<sub>3</sub>R<sup>7</sup>, COMe, COEt, CO-lower alkyl, SCF<sub>3</sub>CN, C<sub>2-6</sub> alkenyl, H, halogens, C<sub>1-4</sub> alkoxy, C<sub>3-6</sub> cycloalkyl, C<sub>1-6</sub> alkyl, aryl, and aryloxy wherein each of the C<sub>3-6</sub> cycloalkyl, C<sub>1-6</sub> alkyl, aryl, or aryloxy groups may be further optionally substituted by up to four substituents in any position independently selected from CF<sub>3</sub>, CCl<sub>3</sub>, Me, NO<sub>2</sub>, OH, OMe, OEt, CONR<sup>5</sup>R<sup>6</sup>, NR<sup>5</sup>R<sup>6</sup>, NHCOCH<sub>3</sub>, OCF<sub>3</sub>, SMe, COOR<sup>7</sup>, SO<sub>3</sub>R<sup>7</sup>, SO<sub>2</sub>NR<sup>5</sup>R<sup>6</sup>, COMe, COEt, CO-lower alkyl, SCF<sub>3</sub>, CN, C<sub>2-6</sub> alkenyl, H, halogens, C<sub>1-4</sub> alkoxy, C<sub>3-6</sub> cycloalkyl, C<sub>1-6</sub> alkyl, and aryl;

15 R<sup>5</sup> and R<sup>6</sup> are independently a H, or C<sub>1-6</sub> alkyl, or C<sub>2-6</sub> alkenyl, or cycloalkyl, or aryl, or CH<sub>2</sub> aryl group and each said group may be optionally substituted by up to four substituents in any position independently selected from CF<sub>3</sub>, CCl<sub>3</sub>, Me, NO<sub>2</sub>, OH, OMe, OEt, CONR<sup>7</sup>R<sup>8</sup>, NR<sup>7</sup>R<sup>8</sup>, NHCOCH<sub>3</sub>, OCF<sub>3</sub>, SMe, COOR<sup>9</sup>, SO<sub>3</sub>R<sup>7</sup>, SO<sub>2</sub>NR<sup>7</sup>R<sup>8</sup>, COMe, COEt, CO-lower alkyl, SCF<sub>3</sub>, CN, C<sub>2-6</sub> alkenyl, H, halogens, C<sub>1-4</sub> alkoxy, C<sub>3-6</sub> cycloalkyl, C<sub>1-6</sub> alkyl, and aryl wherein each of the C<sub>3-6</sub> cycloalkyl, C<sub>1-6</sub> alkyl, or aryl groups may be further optionally substituted by up to four substituents in any position independently selected from CF<sub>3</sub>, CCl<sub>3</sub>, Me, NO<sub>2</sub>, OH, OMe, OEt, CONR<sup>8</sup>R<sup>9</sup>, NR<sup>8</sup>R<sup>9</sup>, NHCOCH<sub>3</sub>, OCF<sub>3</sub>, SMe, COOR<sup>7</sup>, SO<sub>2</sub>NR<sup>8</sup>R<sup>9</sup>, SO<sub>3</sub>R<sup>7</sup>, COMe, COEt, CO-lower alkyl, SCF<sub>3</sub>, CN, C<sub>2-6</sub> alkenyl, H, halogens, C<sub>1-4</sub> alkoxy, C<sub>3-6</sub> cycloalkyl, C<sub>1-6</sub> alkyl, and aryl,

20 25 30 R<sup>5</sup> and R<sup>6</sup> may form part of a 5, 6 or 7 membered cyclic structure which may be either saturated or unsaturated and that may contain up to four heteroatoms selected from O, N or S and said cyclic structure may be optionally substituted by up to four substituents in any position independently selected from CF<sub>3</sub>, CCl<sub>3</sub>, Me,

NO<sub>2</sub>, OH, OMe, OEt, OCF<sub>3</sub>, SMe, COOR<sup>7</sup>, SO<sub>2</sub>NR<sup>8</sup>R<sup>9</sup>, SO<sub>3</sub>R<sup>7</sup>, NHCOCH<sub>3</sub>, COEt, COMe, or halogen;

R<sup>7</sup> may be independently selected from H or C<sub>1-6</sub> alkyl;

R<sup>8</sup> and R<sup>9</sup> are independently a H, or C<sub>1-6</sub> alkyl, or C<sub>2-6</sub> alkenyl, or

5 cycloalkyl, or aryl, or CH<sub>2</sub>aryl group and each said group may be optionally substituted by up to four substituents in any position independently selected from halogen, CF<sub>3</sub>, OCF<sub>3</sub>, OEt, CCl<sub>3</sub>, Me, NO<sub>2</sub>, OH, OMe, SMe, COMe, CN, COOR<sup>7</sup>, SO<sub>3</sub>R<sup>7</sup>, COEt, NHCOCH<sub>3</sub>, or aryl;

an aryl moiety can be a 5 or 6 membered aromatic heterocyclic ring (containing up

10 to 4 hetero atoms independently selected from N, O, or S) or a 6 membered aromatic non-heterocyclic ring or a polycycle;

C<sub>1-6</sub> alkyl moieties can be straight chain or branched;

optionally substituted C<sub>1-6</sub> alkyl moieties can be straight chain or branched;

C<sub>2-6</sub> alkenyl moieties can be straight chain or branched; and

15 optionally substituted C<sub>2-6</sub> alkenyl moieties can be straight chain or

branched.

Examples of suitable C<sub>1-6</sub> alkyl groups include but are not limited to methyl, ethyl, n-propyl, i-propyl, n-butyl, and t-butyl.

Halogens are typically F, Cl, Br, and I.

20 Examples of 5 or 6 membered ring moieties include, but are not restricted to, phenyl, furanyl, thieryl, imidazolyl, pyridyl, pyrrolyl, oxazolyl, isoxazolyl, triazolyl, pyrazolyl, tetrazolyl, thiazolyl and isothiazolyl. Examples of polycycle moieties include, but are not restricted to, naphthyl, benzothiazolyl, benzofuranyl, benzimidazolyl, quinolyl, isoquinolyl, indolyl, quinoxaliny, quinazolinyl and benzothienyl.

25 A more preferred series of compounds possessing 5-HT<sub>2A</sub> receptor activity that are useful as inverse agonists at such receptors is designated by the general formula (B):

(B)

Wherein:

W is Me, or Et, or halogen;

X is either Oxygen or Sulfur;

Y is NR<sup>2</sup>R<sup>3</sup>, or (CH<sub>2</sub>)<sub>m</sub>R<sup>4</sup>, or O(CH<sub>2</sub>)<sub>n</sub>R<sup>4</sup>;Z is lower alkyl (C<sub>1-6</sub>);

m = 0 - 4

n = 0 - 4

R<sup>1</sup> is H or lower alkyl (C<sub>1-4</sub>);R<sup>2</sup> is H or lower alkyl(C<sub>1-4</sub>);R<sup>3</sup> and R<sup>4</sup> are independently a C<sub>1-6</sub> alkyl, or C<sub>2-6</sub> alkenyl, or cycloalkyl, or aryl group and each said group may be optionally substituted by up to foursubstituents in any position independently selected from CF<sub>3</sub>, CCl<sub>3</sub>, Me, NO<sub>2</sub>, OH, OMe, OEt, CONR<sup>5</sup>R<sup>6</sup>, NR<sup>5</sup>R<sup>6</sup>, OCF<sub>3</sub>, SMe, COOR<sup>7</sup>, SO<sub>2</sub>NR<sup>5</sup>R<sup>6</sup>, SO<sub>3</sub>R<sup>7</sup>, COMe,COEt, CO-lower alkyl, SCF<sub>3</sub>CN, C<sub>2-6</sub> alkenyl, H, halogens, C<sub>1-4</sub> alkoxy, C<sub>3-6</sub> cycloalkyl, C<sub>1-6</sub> alkyl, aryl, and aryloxy wherein each of the C<sub>3-6</sub> cycloalkyl, C<sub>1-6</sub>alkyl, aryl, or aryloxy groups may be further optionally substituted by up to four substituents in any position independently selected from CF<sub>3</sub>, CCl<sub>3</sub>, Me, NO<sub>2</sub>, OH, OMe, OEt, CONR<sup>5</sup>R<sup>6</sup>, NR<sup>5</sup>R<sup>6</sup>, NHCOCH<sub>3</sub>, OCF<sub>3</sub>, SMe, COOR<sup>7</sup>, SO<sub>3</sub>R<sup>7</sup>,SO<sub>2</sub>NR<sup>5</sup>R<sup>6</sup>, COMe, COEt, CO-lower alkyl, SCF<sub>3</sub>, CN, C<sub>2-6</sub> alkenyl, H, halogens, C<sub>1-4</sub> alkoxy, C<sub>3-6</sub> cycloalkyl, C<sub>1-6</sub> alkyl, and aryl;

R<sup>5</sup> and R<sup>6</sup> are independently a H, or C<sub>1-6</sub> alkyl, or C<sub>2-6</sub> alkenyl, or cycloalkyl, or aryl, or CH<sub>2</sub> aryl group and each said group may be optionally substituted by up to four substituents in any position independently selected from CF<sub>3</sub>, CCl<sub>3</sub>, Me, NO<sub>2</sub>, OH, OMe, OEt, CONR<sup>7</sup>R<sup>8</sup>, NR<sup>7</sup>R<sup>8</sup>, NHCOCH<sub>3</sub>, OCF<sub>3</sub>, SMe, COOR<sup>9</sup>, SO<sub>3</sub>R<sup>7</sup>, SO<sub>2</sub>NR<sup>7</sup>R<sup>8</sup>, COMe, COEt, CO-lower alkyl, SCF<sub>3</sub>, CN, C<sub>2-6</sub> alkenyl, H, halogens, C<sub>1-4</sub> alkoxy, C<sub>3-6</sub> cycloalkyl, C<sub>1-6</sub> alkyl, and aryl wherein each of the C<sub>3-6</sub> cycloalkyl, C<sub>1-6</sub> alkyl, or aryl groups may be further optionally substituted by up to four substituents in any position independently selected from CF<sub>3</sub>, CCl<sub>3</sub>, Me, NO<sub>2</sub>, OH, OMe, OEt, CONR<sup>8</sup>R<sup>9</sup>, NR<sup>8</sup>R<sup>9</sup>, NHCOCH<sub>3</sub>, OCF<sub>3</sub>, SMe, COOR<sup>7</sup>, SO<sub>2</sub>NR<sup>8</sup>R<sup>9</sup>, SO<sub>3</sub>R<sup>7</sup>, COMe, COEt, CO-lower alkyl, SCF<sub>3</sub>, CN, C<sub>2-6</sub> alkenyl, H, halogens, C<sub>1-4</sub> alkoxy, C<sub>3-6</sub> cycloalkyl, C<sub>1-6</sub> alkyl, and aryl,

or R<sup>5</sup> and R<sup>6</sup> may form part of a 5, 6 or 7 membered cyclic structure which may be either saturated or unsaturated and that may contain up to four heteroatoms selected from O, N or S and said cyclic structure may be optionally substituted by up to four substituents in any position independently selected from CF<sub>3</sub>, CCl<sub>3</sub>, Me, NO<sub>2</sub>, OH, OMe, OEt, OCF<sub>3</sub>, SMe, COOR<sup>7</sup>, SO<sub>2</sub>NR<sup>8</sup>R<sup>9</sup>, SO<sub>3</sub>R<sup>7</sup>, NHCOCH<sub>3</sub>, COEt, COMe, or halogen;

R<sup>7</sup> may be independently selected from H or C<sub>1-6</sub> alkyl;

R<sup>8</sup> and R<sup>9</sup> are independently a H, or C<sub>1-6</sub> alkyl, or C<sub>2-6</sub> alkenyl, or

cycloalkyl, or aryl, or CH<sub>2</sub>aryl group and each said group may be optionally substituted by up to four substituents in any position independently selected from halogen, CF<sub>3</sub>, OCF<sub>3</sub>, OEt, CCl<sub>3</sub>, Me, NO<sub>2</sub>, OH, OMe, SMe, COMe, CN, COOR<sup>7</sup>, SO<sub>3</sub>R<sup>7</sup>, COEt, NHCOCH<sub>3</sub>, or aryl;

an aryl moiety can be a 5 or 6 membered aromatic heterocyclic ring (containing up to 4 hetero atoms independently selected from N, O, or S) or a 6 membered aromatic non-heterocyclic ring or a polycycle;

C<sub>1-6</sub> alkyl moieties can be straight chain or branched;

optionally substituted C<sub>1-6</sub> alkyl moieties can be straight chain or branched;

C<sub>2-6</sub> alkenyl moieties can be straight chain or branched; and

optionally substituted C<sub>2-6</sub> alkenyl moieties can be straight chain or branched.

Examples of suitable C<sub>1-6</sub> alkyl groups include but are not limited to methyl, ethyl, n-propyl, i-propyl, n-butyl, and t-butyl.

Halogens are typically F, Cl, Br, and I.

Examples of 5 or 6 membered ring moieties include, but are not restricted to, phenyl, furanyl, thienyl, imidazolyl, pyridyl, pyrrolyl, oxazolyl, isoxazolyl, triazolyl, pyrazolyl, tetrazolyl, thiazolyl and isothiazolyl. Examples of polycycle moieties include, 5 but are not restricted to, naphthyl, benzothiazolyl, benzofuranyl, benzimidazolyl, quinolyl, isoquinolyl, indolyl, quinoxaliny, quinazolinyl and benzothienyl.

A first series of compounds having 5-HT<sub>2A</sub> receptor activity is represented by a class (I) of compounds of formula (B) wherein Y=NR<sup>2</sup>R<sup>3</sup>:

10

Wherein:

Preferably R<sup>1</sup> and R<sup>2</sup> are H.

Preferably W is Br.

Preferably X is O.

15

Preferably Z is Me.

Preferably R<sup>3</sup> is 4-trifluoromethoxyphenyl or 4-trifluoromethoxybenzyl.

Preferred compounds are:

37

103487

N-[3-(4-bromo-1-methylpyrazol-3-yl)phenyl][{(4-trifluoromethoxy)phenyl}amino] carboxamide

5

116115

N-[3-(4-bromo-1-methylpyrazol-3-yl)phenyl][{(4-trifluoromethoxy)phenyl)methyl}amino]carboxamide

10

These two compounds demonstrated the following activities using the assay protocols defined in the Examples above:

Compound Number	Competitive Binding AP-1 ([ <sup>3</sup> H]mesulergine) IC <sub>50</sub> Value ( $\mu$ M)	Competitive Binding WT 5HT <sub>2A</sub> ([ <sup>3</sup> H]LSD) IC <sub>50</sub> Value ( $\mu$ M)	Inositol Phosphate Accumulation AP-3 IC <sub>50</sub> Value ( $\mu$ M)
103487	2.1	.046	.052
116115	1.2	.45	.0171

Additional compounds of formula (B) wherein Y=NR<sup>2</sup>R<sup>3</sup> are set forth below.

Inositol phosphate accumulation assays evidence the activity of test compounds. Both single concentration percentages of control values and IC<sub>50</sub> determinations indicate activity. In the tables below the column legends have the following meanings:

IP<sub>3</sub> % Control: The values in this column reflect an IP Accumulation Assay where the test compounds were evaluated at one concentration of 10  $\mu$ M. For these assays, the compound was diluted into inositol-free Dulbecco's Eagle Media containing 10  $\mu$ M pargyline and 10 mM LiCl and tested at a final assay concentration of 10  $\mu$ M, in triplicate. The percent control value was calculated based on the control in which no test compound was added.

IP<sub>3</sub> AP-3 IC<sub>50</sub> nM: The values in this column reflect an IP accumulation assay in which the test compound was evaluated at several different concentrations whereby an IC<sub>50</sub> could be determined. This column corresponds to the column appearing in the tables above which is labeled: Inositol Phosphate Accumulation, AP-3, IC<sub>50</sub> Value ( $\mu$ M).

WT 5HT<sub>2A</sub> LSD IC<sub>50</sub> nM: The values in this column reflect a competitive binding assay using LSD. This column corresponds to the column appearing in the tables above which is labeled: Competitive Binding, WT 5HT<sub>2A</sub>, ([<sup>3</sup>H]LSD), IC<sub>50</sub> Value ( $\mu$ M).

Compounds listed in each of the following tables reference the structures immediately preceding the table. A "dash" in the table indicates that no value was determined.

5 A second series of compounds having 5-HT<sub>2A</sub> receptor activity is represented by a class (II) of compounds of formula (B) wherein Y= O(CH<sub>2</sub>)<sub>n</sub>R<sup>4</sup>:

Wherein:

10 Preferably R<sup>1</sup> is H.  
 Preferably W is Br.  
 Preferably X is O.  
 Preferably Z is Me.  
 Preferably when n = 0, R<sup>4</sup> is 4-methoxyphenyl or tertiary butyl.

15 Preferred compounds are:

116100

N-[3-(4-bromo-1-methylpyrazol-3-yl)phenyl][4-methoxyphenoxy]carboxamide

116192

(tert-butoxy)-N-[3-(4-bromo-1-methylpyrazol-3-yl)phenyl]carboxamide

5

These two compounds demonstrated the following activity:

Compound No.	Competitive Binding AP-1 ([ <sup>3</sup> H]mesulergine) IC <sub>50</sub> Value (μM)	Competitive Binding WT 5HT <sub>2A</sub> ([ <sup>3</sup> H]LSD) IC <sub>50</sub> Value (μM)	Inositol Phosphate Accumulation AP-3 IC <sub>50</sub> Value (μM)
116100	1.8	<0.001	0.0003

116192	-	0.014	0.057
--------	---	-------	-------

In addition to the assays discussed above, the specific activity of 116100 at the 5HT<sub>2A</sub> receptor was further confirmed by the following.

In Vitro Binding of 5HT<sub>2A</sub> Receptor

5    Animals:

Animals (Sprague-Dawley rats) were sacrificed and brains were rapidly dissected and frozen in isopentane maintained at -42°C. Horizontal sections were prepared on a cryostat and maintained at -20°C.

LSD Displacement Protocol:

10       Lysergic acid diethylamide (LSD) is a potent 5HT2A receptor and dopamine D2 receptor ligand. An indication of the selectivity of compounds for either or both of these receptors involves displacement of radiolabeled-bound LSD from pre-treated brain sections. For these studies, radiolabeled I<sup>125</sup>-LSD (NEN Life Sciences, Boston, MA., Catalogue number NEX-199) was utilized; spiperone (RBI, Natick, MA. Catalogue number s-128), a  
15      5HT2A receptor and dopamine D2 receptor antagonist, was also utilized. Buffer consisted of 50 nanomolar TRIS-HCl, pH 7.4

Brain sections were incubated in (a) Buffer plus 1 nanomolar I<sup>125</sup>-LSD; (b) Buffer plus 1 nanomolar I<sup>125</sup>-LSD and 1 micromolar spiperone; or Buffer plus 1 nanomolar I<sup>125</sup>-LSD and 1 micromolar 116100 for 30 minutes at room temperature. Sections were then  
20      washed 2X 10 minutes at 4°C in Buffer, followed by 20 seconds in distilled H<sub>2</sub>O. Slides were then air-dried.

After drying, sections were apposed to x-ray film (Kodak Hyperfilm) and exposed for 4 days.

Analysis:

25       Figures 16A-C provide representative autoradiographic sections from this study. Figure 16A evidences darker bands (derived from I<sup>125</sup>-LSD binding) primarily in both the fourth layer of the cerebral cortex (primarily 5HT<sub>2A</sub> receptors), and the caudate nucleus (primarily dopamine D2 receptors and some 5HT<sub>2A</sub> receptors). As can be seen from Figure 16B, spiperone, which is a 5HT<sub>2A</sub> and dopamine D2 antagonist, displaces the I<sup>125</sup>-LSD from  
30      these receptors on both the cortex and the caudate. As can be further seen from Figure 16C, 116100 appears to selectively displace the I<sup>125</sup>-LSD from the cortex (5HT<sub>2A</sub>) and not the caudate (dopamine D2).

A third series of compounds having 5-HT<sub>2A</sub> receptor activity is represented by a class (III) of compounds of formula (B) wherein Y= (CH<sub>2</sub>)<sub>m</sub>R<sup>4</sup>:

5

Wherein:

Preferably W is Br.

Preferably X is O.

Preferably Z is Me.

Preferably R<sup>1</sup> is H.

10

Preferably when m = 0, R<sup>4</sup> is preferably 4-trifluoromethoxyphenyl, or thiophene, or 4-chlorophenyl.

Preferred compounds are:

116101

15

m = 0, R<sup>1</sup> = H, R<sup>4</sup> = 4-trifluoromethoxyphenyl

N-[3-(4-bromo-1-methylpyrazol-3-yl)phenyl][4-trifluoromethoxyphenyl]carboxamide

116102

5

 $m = 0, R^1 = H, R^4 = \text{thiophene}$ 

N-[3-(4-bromo-1-methylpyrazol-3-yl)phenyl][2-thienyl]carboxamide

10

116120

 $m = 0, R^1 = H, R^4 = 4\text{-chlorophenyl}$ 

N-[3-(4-bromo-1-methylpyrazol-3-yl)phenyl][4-chlorophenyl]carboxamide

These three compounds demonstrated the following activities:

Compound Number	Competitive Binding AP-1 ([ <sup>3</sup> H]mesulergine) IC <sub>50</sub> Value (μM)	Competitive Binding WT 5HT <sub>2A</sub> ([ <sup>3</sup> H]LSD) IC <sub>50</sub> Value (μM)	Inositol Phosphate Accumulation AP-3 IC <sub>50</sub> Value (μM)
116101	6.1	.46	0.0213
116102	2.8	.17	0.080
116120	1.2	.21	0.0315

#### In Vivo Analysis of Compound 116102

In addition to the in vitro assays shown in the above table, the in vivo response of animals to the 116102 compound is demonstrated by the following.

A 5HT<sub>2A</sub> receptor antagonist or inverse agonist is expected to decrease amphetamine-stimulated locomotion without affecting baseline locomotion. *See, for example,* Soresnon, et al, 266(2) J. Pharmacol. Exp. Ther. 684 (1993). Based upon the foregoing information, Compound 116102 is a potent inverse agonist at the human 5HT2A receptor. For the following study, the following parameters and protocol were utilized:

#### Animals, Vehicle

Adult male Sprague-Dawley rats were utilized for these studies. Animals were housed in groups of 2-3 in hanging plastic cages with food and water available at all times. Animals were weighed and handled for at least one day prior to surgery and throughout the studies. For these studies, Vehicle consisted of 90% ethanol (100%) and 10% water.

Amphetamine-stimulated locomotor activity: Assessment and Apparatus

A San Diego Instruments Flex Field apparatus was used to quantify baseline and amphetamine-stimulated locomotor activity. This apparatus consists of four 16" x 16" clear plastic open fields. Photocell arrays (16 in each dimension) interfaced with a personal computer to automatically quantify activity. Several measures of activity can be assessed with the apparatus, including total photocell beam breaks. Animals (vehicle control and Compound treated) were injected s.c. 30 minutes prior to initiation of analysis. Following this 30 minute period, animals were placed individually into an open field and baseline activity was assessed for 30 minutes (habituation phase). Following baseline, animals were removed, injected with d-amphetamine sulfate (1.0 mg/kg) and immediately returned to the open field for 150 minutes, in order to follow the time course (10 minute intervals) of amphetamine-stimulated locomotor activity.

Dosing

Vehicle Control	Compound 116102	Dose (mg/kg)
6 animals	6 animals	0.1
	6 animals	1.0
	6 animals	5.0
	6 animals	10.0

Analysis

Results, based upon the number of recorded photobeam breaks (mean +/- sem), are presented in Figure 17A-C. As supported by Figures 17A,B and C, a general "inverted U" shaped pattern was observed (*see, generally, Sahgal, A. "Practical behavioural neuroscience: problems, pitfalls and suggestions" pp 1-8, 5 in Behavioral Neuroscience: A Practical Approach, Volume 1 A. Sahgal (Ed.) 1993, IRL Press, New York.*) As Figure 17 also indicates, with exception of the highest dose (10mg/kg), *in vivo*, the tested doses of Compound 116102 evidenced a decrease in the amphetamine-stimulated locomotion, consistent with a 5HT2A receptor antagonist or inverse agonist.

Additional compounds of formula (B) wherein Y=  $(CH_2)_m R^4$  are set forth below.

Compound No.	R¹	R²	R³	R⁴	IP <sub>3</sub> IC <sub>50</sub> nM	LSD IC <sub>50</sub> nM

compound names not provided

Based upon the discovery of the specific inverse agonist activity of the above identified compounds at the 5HT<sub>2A</sub> receptor, a novel class of compounds has been identified which exhibits said activity. Accordingly, in the second aspect of the invention, there is provided a novel compound of formula (C):

(C)

Wherein:

W is Me, or Et, or halogen;

X is either Oxygen or Sulfur;

Y is NR<sup>2</sup>R<sup>3</sup>, or (CH<sub>2</sub>)<sub>m</sub>R<sup>4</sup>, or O(CH<sub>2</sub>)<sub>n</sub>R<sup>4</sup>;

Z is lower alkyl (C<sub>1-6</sub>);

m = 0 - 4;

n = 0 - 4;

R<sup>1</sup> is H or lower alkyl (C<sub>1-4</sub>);

R<sup>2</sup> is H or lower alkyl(C<sub>1-4</sub>);

R<sup>3</sup> is a C<sub>1-6</sub> alkyl, or C<sub>2-6</sub> alkenyl, or cycloalkyl, or (CH<sub>2</sub>)<sub>k</sub>aryl group (k = 1 - 4), preferably k = 1, and each said group may be optionally substituted by up to four substituents in any position independently selected from CF<sub>3</sub>, CCl<sub>3</sub>, Me, NO<sub>2</sub>, OH,

OMe, OEt, CONR<sup>5</sup>R<sup>6</sup>, NR<sup>5</sup>R<sup>6</sup>, OCF<sub>3</sub>, SMe, COOR<sup>7</sup>, SO<sub>2</sub>NR<sup>5</sup>R<sup>6</sup>, SO<sub>3</sub>R<sup>7</sup>, COMe, COEt, CO-lower alkyl, SCF<sub>3</sub>CN, C<sub>2-6</sub> alkenyl, H, halogens, C<sub>1-4</sub> alkoxy, C<sub>3-6</sub> cycloalkyl, C<sub>1-6</sub> alkyl, aryl, and aryloxy wherein each of the C<sub>3-6</sub> cycloalkyl, C<sub>1-6</sub> alkyl, aryl, or aryloxy groups may be further optionally substituted by up to four substituents in any position independently selected from CF<sub>3</sub>, CCl<sub>3</sub>, Me, NO<sub>2</sub>, OH, OMe, OEt, CONR<sup>5</sup>R<sup>6</sup>, NR<sup>5</sup>R<sup>6</sup>, NHCOCH<sub>3</sub>, OCF<sub>3</sub>, SMe, COOR<sup>7</sup>, SO<sub>3</sub>R<sup>7</sup>, SO<sub>2</sub>NR<sup>5</sup>R<sup>6</sup>, COMe, COEt, CO-lower alkyl, SCF<sub>3</sub>, CN, C<sub>2-6</sub> alkenyl, H, halogens, C<sub>1-4</sub> alkoxy, C<sub>3-6</sub> cycloalkyl, C<sub>1-6</sub> alkyl, and aryl;

R<sup>4</sup> is a C<sub>1-6</sub> alkyl, or C<sub>2-6</sub> alkenyl, or cycloalkyl, or aryl group and each said group may be optionally substituted by up to four substituents in any position independently selected from CF<sub>3</sub>, CCl<sub>3</sub>, Me, NO<sub>2</sub>, OH, OMe, OEt, CONR<sup>5</sup>R<sup>6</sup>, NR<sup>5</sup>R<sup>6</sup>, OCF<sub>3</sub>, SMe, COOR<sup>7</sup>, SO<sub>2</sub>NR<sup>5</sup>R<sup>6</sup>, SO<sub>3</sub>R<sup>7</sup>, COMe, COEt, CO-lower alkyl, SCF<sub>3</sub>CN, C<sub>2-6</sub> alkenyl, H, halogens, C<sub>1-4</sub> alkoxy, C<sub>3-6</sub> cycloalkyl, C<sub>1-6</sub> alkyl, aryl, and aryloxy wherein each of the C<sub>3-6</sub> cycloalkyl, C<sub>1-6</sub> alkyl, aryl, or aryloxy groups may be further optionally substituted by up to four substituents in any position independently selected from CF<sub>3</sub>, CCl<sub>3</sub>, Me, NO<sub>2</sub>, OH, OMe, OEt, CONR<sup>5</sup>R<sup>6</sup>, NR<sup>5</sup>R<sup>6</sup>, NHCOCH<sub>3</sub>, OCF<sub>3</sub>, SMe, COOR<sup>7</sup>, SO<sub>3</sub>R<sup>7</sup>, SO<sub>2</sub>NR<sup>5</sup>R<sup>6</sup>, COMe, COEt, CO-lower alkyl, SCF<sub>3</sub>, CN, C<sub>2-6</sub> alkenyl, H, halogens, C<sub>1-4</sub> alkoxy, C<sub>3-6</sub> cycloalkyl, C<sub>1-6</sub> alkyl, and aryl;

R<sup>5</sup> and R<sup>6</sup> are independently a H, or C<sub>1-6</sub> alkyl, or C<sub>2-6</sub> alkenyl, or cycloalkyl, or aryl, or CH<sub>2</sub> aryl group and each said group may be optionally substituted by up to four substituents in any position independently selected from CF<sub>3</sub>, CCl<sub>3</sub>, Me, NO<sub>2</sub>, OH, OMe, OEt, CONR<sup>7</sup>R<sup>8</sup>, NR<sup>7</sup>R<sup>8</sup>, NHCOCH<sub>3</sub>, OCF<sub>3</sub>, SMe, COOR<sup>9</sup>, SO<sub>3</sub>R<sup>7</sup>, SO<sub>2</sub>NR<sup>7</sup>R<sup>8</sup>, COMe, COEt, CO-lower alkyl, SCF<sub>3</sub>, CN, C<sub>2-6</sub> alkenyl, H, halogens, C<sub>1-4</sub> alkoxy, C<sub>3-6</sub> cycloalkyl, C<sub>1-6</sub> alkyl, and aryl wherein each of the C<sub>3-6</sub> cycloalkyl, C<sub>1-6</sub> alkyl, or aryl groups may be further optionally substituted by up to four substituents in any position independently selected from CF<sub>3</sub>, CCl<sub>3</sub>, Me, NO<sub>2</sub>, OH, OMe, OEt, CONR<sup>8</sup>R<sup>9</sup>, NR<sup>8</sup>R<sup>9</sup>, NHCOCH<sub>3</sub>, OCF<sub>3</sub>, SMe, COOR<sup>7</sup>, SO<sub>2</sub>NR<sup>8</sup>R<sup>9</sup>, SO<sub>3</sub>R<sup>7</sup>, COMe, COEt, CO-lower alkyl, SCF<sub>3</sub>, CN, C<sub>2-6</sub> alkenyl, H, halogens, C<sub>1-4</sub> alkoxy, C<sub>3-6</sub> cycloalkyl, C<sub>1-6</sub> alkyl, and aryl,

or R<sup>5</sup> and R<sup>6</sup> may form part of a 5, 6 or 7 membered cyclic structure which may be either saturated or unsaturated and that may contain up to four heteroatoms selected from O, N or S and said cyclic structure may be optionally substituted by up

to four substituents in any position independently selected from  $\text{CF}_3$ ,  $\text{CCl}_3$ , Me,  $\text{NO}_2$ , OH, OMe, OEt,  $\text{OCF}_3$ , SMe,  $\text{COOR}^7$ ,  $\text{SO}_2\text{NR}^8\text{R}^9$ ,  $\text{SO}_3\text{R}^7$ ,  $\text{NHCOCH}_3$ , COEt, COMe, or halogen;

$\text{R}^7$  may be independently selected from H or  $\text{C}_{1-6}$  alkyl;

5        $\text{R}^8$  and  $\text{R}^9$  are independently a H, or  $\text{C}_{1-6}$  alkyl, or  $\text{C}_{2-6}$  alkenyl, or cycloalkyl, or aryl, or  $\text{CH}_2$ aryl group and each said group may be optionally substituted by up to four substituents in any position independently selected from halogen,  $\text{CF}_3$ ,  $\text{OCF}_3$ , OEt,  $\text{CCl}_3$ , Me,  $\text{NO}_2$ , OH, OMe, SMe, COMe, CN,  $\text{COOR}^7$ ,  $\text{SO}_3\text{R}^7$ , COEt,  $\text{NHCOCH}_3$ , or aryl;

10      an aryl moiety can be a 5 or 6 membered aromatic heterocyclic ring (containing up to 4 hetero atoms independently selected from N, O, or S) or a 6 membered aromatic non-heterocyclic ring or a polycycle;

$\text{C}_{1-6}$  alkyl moieties can be straight chain or branched;

optionally substituted  $\text{C}_{1-6}$  alkyl moieties can be straight chain or branched;

15       $\text{C}_{2-6}$  alkenyl moieties can be straight chain or branched; and

optionally substituted  $\text{C}_{2-6}$  alkenyl moieties can be straight chain or

branched;

with the proviso that said compound is not:

N-[3-(4-bromo-1-methylpyrazol-3-yl)phenyl][methylamino]carboxamide, or

20      N-[3-(4-bromo-1-methylpyrazol-3-yl)phenyl][{(4-trifluoromethoxy)phenyl}amino] carboxamide, or

N-[3-(4-bromo-1-methylpyrazol-3-yl)phenyl][2-chlorophenyl]carboxamide, or

N-[3-(4-bromo-1-methylpyrazol-3-yl)phenyl][2-chloro-3-pyridyl]carboxamide, or

N-[3-(4-bromo-1-methylpyrazol-3-yl)phenyl][trichloromethyl]carboxamide.

25      Examples of suitable  $\text{C}_{1-6}$  alkyl groups include but are not limited to methyl, ethyl, n-propyl, i-propyl, n-butyl, and t-butyl.

Halogens are typically F, Cl, Br, and I.

Examples of 5 or 6 membered ring moieties include, but are not restricted to, phenyl, furanyl, thienyl, imidazolyl, pyridyl, pyrrolyl, oxazolyl, isoxazolyl, triazolyl, pyrazolyl, tetrazolyl, thiazolyl and isothiazolyl. Examples of polycycle moieties include, but are not restricted to, naphthyl, benzothiazolyl, benzofuranyl, benzimidazolyl, quinolyl, isoquinolyl, indolyl, quinoxalinyl, quinazolinyl and benzothienyl.

Synthetic Approaches

The compounds disclosed in this invention may be readily prepared according to a variety of synthetic manipulations, all of which would be familiar to one skilled in the art. In the general syntheses set forth below, the labeled substituents have the same identifications as set out in the definitions of the compounds above.

Compounds of general formula (I) can be obtained *via* a variety of synthetic routes all of which would be familiar to one skilled in the art. The reaction of isocyanates with amines is a commonly practised method for the formation of ureas (see Org. Syn. Coll. Vol. V, (1973), 555). Amine (IV), 3-(4-bromo-1-methylpyrazole-3-yl)phenylamine, commercially available from Maybridge Chemical Company, Catalog No. KM01978, CAS No. 175201-77-1] reacts readily with isocyanates (V) in inert solvents such as halocarbons to yield the desired ureas of general formula (I) wherein R<sup>1</sup> = R<sup>2</sup> = H:

Alternatively the amine (IV) can be converted to the corresponding isocyanate (VI) by the action of phosgene or a suitable phosgene equivalent, e.g. triphosgene, in an inert solvent such as a halocarbon in the presence of an organic base such as triethylamine or ethyldiisopropylamine. Isocyanate (VI) reacts with amines of general formula (VII), in an analogous fashion to that described above for the reaction of (IV) with (V), yielding the desired ureas of general formula (I) wherein R<sup>1</sup> = H:

Alternatively wherein the isocyanate of general formula (V) is not commercially available it can be prepared from the corresponding amine of general formula (VIII) in an analogous procedure to that described above for the preparation of (VI). Reaction of these isocyanates with (IV) would again yield the requisite ureas of general formula (I) wherein R<sup>1</sup> = R<sup>2</sup> = H:

Amines of general formula (VII) are also readily converted to activated isocyanate equivalents of general formula (IX) by the sequential action of carbonyldiimidazole and methyl iodide in tetrahydrofuran and acetonitrile respectively (R.A. Batey *et al*, *Tetrahedron Lett.*, (1998), 5 39, 6267-6270.) Reaction of (IX) with (IV) in an inert solvent such as a halocarbon would yield the requisite ureas of general formula (I) wherein  $\text{R}^1 = \text{H}$ :

Amine (IV) may be monomethylated according to the procedure of J. Barluenga *et al*, *J. Chem. Soc., Chem. Commun.*, (1984), 20, 1334-1335, or alkylated according to the procedure of P. Marchini *et al*, *J. Org. Chem.*, (1975), 40(23), 3453-3456, to yield compounds of general formula (X) wherein  $\text{R}^1$  = lower alkyl. These materials may be reacted as above with reagents of general formula (V) and (IX) as depicted below:

Compounds of general formula (II) can similarly be obtained *via* a variety of synthetic manipulations, all of which would be familiar to one skilled in the art. The reaction of amine (IV) with chloroformates (see Org. Syn. Coll. Vol. IV, (1963), 780) of general formula (XI) in an inert solvent such as ether or halocarbon in the presence of a tertiary base such as triethylamine or ethyldiisopropylamine readily yields the requisite carbamates of general formula (II) wherein  $R^1 =$

H. Analogously amines of general formula (X) react similarly with chloroformates (XI) to yield the requisite carbamates of general formula (II) wherein R<sup>1</sup> = lower alkyl:

An alternative route employs the ready reaction of an alcohol with an isocyanate. Thus isocyanate (VI) described previously reacts readily with alcohols (XII) in an aprotic solvent such as ether or chlorocarbon to yield the desired carbamates of general formula (II) wherein R<sup>1</sup> = H:

Chloroformates of general formula (XI) not commercially available may be readily prepared from the corresponding alcohol (XII) in an inert solvent such as toluene, chlorocarbon or ether by the action of excess phosgene (see Org. Syn. Coll. Vol. III, (1955), 167):

5

Compounds of general formula (III) can be obtained *via* a variety of synthetic manipulations, all of which would be familiar to one skilled in the art. The reaction of amine (IV) with acid chlorides (see Org. Syn. Coll. Vol. V, (1973), 336) of general formula (XIII) to yield the desired amides (III) wherein R<sup>1</sup> = H is readily achieved in an inert solvent such as chloroform or dichloromethane in the presence of an organic base such as triethylamine or ethyldiisopropylamine. In an identical fashion amines of general formula (X) would react with acid chlorides (XIII) to yield the desired amides (III) wherein R<sup>1</sup> = lower alkyl:

Alternatively the corresponding acids of general formula (**XIV**) may be coupled with dicyclohexylcarbodiimide (DCC)/hydroxybenzotriazole (HOBT) (see W. Konig *et al*, *Chem. Ber.*, 1970, **103**, 788) or hydroxybenzotriazole (HOBT)/2-(1H-benzotriazole-1-yl)-1,1,3,3-tetramethyluronium hexafluorophosphate (HBTU) (see M. Bernatowicz *et al.*, *Tetrahedron Lett.*, 1989, **30**, 4645) as condensing agents in dimethylformamide or chloroform to amines (**IV**) and (**X**) respectively yielding products identical to those described in the previous scheme:

The acids of general formula (XIV) are readily converted to the corresponding acid chlorides (XIII) by the action of thionyl chloride or oxalyl chloride in the presence of catalytic dimethylformamide:

5

A third aspect of the present invention provides a compound of formula (A) or a solvate or physiologically functional derivative thereof for use as a therapeutic agent, specifically as a modifier of the activity of the serotonin 5-HT<sub>2A</sub> receptor. Modifiers of the activity of the serotonin 5-HT<sub>2A</sub> receptor are believed to be of potential use for the treatment or prophylaxis of CNS, 10 gastrointestinal, cardiovascular, and inflammatory disorders. Compounds of the formula (A) may be administered by oral, sublingual, parenteral, rectal, or topical administration. In addition to the neutral forms of compounds of formula (A) by appropriate addition of an ionizable substituent, which does not alter the receptor specificity of the compound, physiologically acceptable salts of the compounds may also be formed and used as therapeutic agents. Different amounts of the 15 compounds of formula (A) will be required to achieve the desired biological effect. The amount will depend on factors such as the specific compound, the use for which it is intended, the means of administration, and the condition of the treated individual. A typical dose may be expected to fall in the range of 0.001 to 200 mg per kilogram of body weight of the treated individual. Unit doses may contain from 1 to 200 mg of the compounds of formula (A) and may be administered one or more 20 times a day, individually or in multiples. In the case of the salt or solvate of a compound of formulas (A), the dose is based on the cation (for salts) or the unsolvated compound.

A fourth aspect of the present invention provides pharmaceutical compositions comprising at least one compound of formula (A) and/or a pharmacologically acceptable salt or solvate thereof as an active ingredient combined with at least one pharmaceutical carrier or excipient. Such pharmaceutical compositions may be used in the treatment of clinical conditions for which a modifier of the activity of the serotonin 5-HT<sub>2A</sub> receptor is indicated. At least one compound of formula (A) may be combined with the carrier in either solid or liquid form in a unit dose formulation. The pharmaceutical carrier must be compatible with the other ingredients in the composition and must be tolerated by the individual recipient. Other physiologically active ingredients may be incorporated into the pharmaceutical composition of the invention if desired, and if such ingredients are compatible with the other ingredients in the composition. Formulations may be prepared by any suitable method, typically by uniformly mixing the active compound(s) with liquids or finely divided solid carriers, or both, in the required proportions, and then, if necessary, forming the resulting mixture into a desired shape.

Conventional excipients, such as binding agents, fillers, acceptable wetting agents, tabletting lubricants, and disintegrants may be used in tablets and capsules for oral administration. Liquid preparations for oral administration may be in the form of solutions, emulsions, aqueous or oily suspensions, and syrups. Alternatively, the oral preparations may be in the form of dry powder which can be reconstituted with water or another suitable liquid vehicle before use. Additional additives such as suspending or emulsifying agents, non-aqueous vehicles (including edible oils), preservatives, and flavorings and colorants may be added to the liquid preparations. Parenteral dosage forms may be prepared by dissolving the compound of the invention in a suitable liquid vehicle and filter sterilizing the solution before filling and sealing an appropriate vial or ampoule. These are just a few examples of the many appropriate methods well known in the art for preparing dosage forms.

The fifth aspect of the present invention provides for the use of a compound of formula (A) in the preparation of a medicament for the treatment of a medical condition for which a modifier of the activity of the serotonin 5-HT<sub>2A</sub> receptor is indicated.

A sixth aspect of the present invention provides for a method of treatment of a clinical condition of a mammal, such as a human, for which a modifier of the activity of the serotonin 5-HT<sub>2A</sub> receptor is indicated, which comprises the administration to the mammal

of a therapeutically effective amount of a compound of formula (A) or a physiologically acceptable salt, solvate, or physiologically functional derivative thereof.

#### Experimental Data

Mass spectra were recorded on a Micromass Platform LC with Gilson HPLC. Infrared spectra were recorded on a Nicolet Avatar 360 FT-IR. Melting points were recorded on a Electrothermal IA9200 apparatus and are uncorrected. Proton nuclear magnetic resonance spectra were recorded on a Bruker 300MHz machine. Chemical shifts are given with respect to tetramethylsilane. In the text the following abbreviations are used; s (singlet), d (doublet), t (triplet), m (multiplet) or combinations thereof. Chemical shifts are quoted in parts per million (ppm) and with coupling constants in Hertz.

Thin layer chromatography was carried out using aluminium backed silica plates (250 $\mu$ L; GF<sub>254</sub>). HPLC was recorded either on a HP Chemstation 1100 HPLC using a Hichrom 3.5 C18 reverse phase column (50mm x 2.1mm i.d.). Linear gradient elution over 5 minutes – 95% water (+0.1% TFA) / 5% acetonitrile (+0.05% TFA) down to 5% water / 95% acetonitrile. Flow rate 0.8mL/min [Method A]; or on a Hichrom 3.5 C18 reverse phase column (100mm x 3.2mm i.d.). Linear gradient elution over 11 minutes – 95% water (+0.1% TFA) / 5% acetonitrile (+0.05% TFA) down to 5% water / 95% acetonitrile. Flow rate 1mL/min [Method B]. Samples were routinely monitored at 254nM unless otherwise stated.

All reagents were purchased from commercial sources.

N-[3-(4-bromo-1-methylpyrazol-3-yl)phenyl][{(4-trifluoromethoxy)phenyl}amino] carboxamide

This compound is commercially available from Maybridge Chemical Company, Catalog No. KM04515.

#### Experiment 2

##### Preparation and Analysis of 116100

N-[3-(4-bromo-1-methylpyrazol-3-yl)phenyl][4-methoxyphenoxy]carboxamide

To 4-methoxyphenylchloroformate (19mg, 0.10mmol) in CH<sub>2</sub>Cl<sub>2</sub> (0.5mL) was added dropwise a solution of 3-(3-aminophenyl)-4-bromo-1-methylpyrazole (25mg, 0.10mmol) and triethylamine (14 $\mu$ L, 0.10mmol) in CH<sub>2</sub>Cl<sub>2</sub> (0.5mL). The mixture was stirred for 16 h and

concentrated. Chromatography on flash silica (40% EtOAc/hexane) gave the title compound as a colourless solid (21mg, 52%), m.p. 140.3-141.8°C (EtOAc/hexane).

IR:  $\nu_{\text{max}} = 1748, 1592, 1504, 1412, 1190, 835, 764, 676 \text{ cm}^{-1}$ . MS (ES+):  $m/z$  (%) = 404 ( $M+H^{81}\text{Br}$ , 100), 402 ( $M+H^{79}\text{Br}$ , 90).

<sup>5</sup>  $^1\text{H-NMR}$  ( $\text{CD}_3\text{OD}$ ):  $\delta = 3.80$  (3H, s,  $\text{CH}_3$ ), 3.81 (3H, s,  $\text{CH}_3$ ), 6.91-6.98 (2H, m, ArH), 7.07-7.18 (3H, m, ArH), 7.42-7.53 (4H, m, ArH). HPLC: retention time 3.28 mins [Method A]. Tlc : Rf 0.4 (EtOAc/hexane).

### Experiment 3

#### Preparation and Analysis of 116101

N-[3-(4-bromo-1-methylpyrazol-3-yl)phenyl][4-trifluoromethoxyphenyl]carboxamide

To 4-(trifluoromethoxy)benzoyl chloride (19 $\mu\text{L}$ , 0.12mmol) in  $\text{CH}_2\text{Cl}_2$  (1mL) was added dropwise a solution of 3-(3-aminophenyl)-4-bromo-1-methylpyrazole (30mg, 0.12mmol) and triethylamine (17 $\mu\text{L}$ , 0.12mmol) in  $\text{CH}_2\text{Cl}_2$  (0.5mL). The reaction mixture <sup>15</sup> was stirred for 16 h and concentrated. Chromatography on flash silica (50% EtOAc/hexane) gave the title compound as a colourless solid (40mg, 76%), m.p. 138.6-139.6°C (EtOAc/hexane).

MS (ES+):  $m/z$  (%) = 442 ( $M+H^{81}\text{Br}$ , 93), 440 ( $M+H^{79}\text{Br}$ , 100).

<sup>20</sup>  $^1\text{H-NMR}$  ( $\text{DMSO d}_6$ ):  $\delta = 3.79$  (3H, s,  $\text{CH}_3$ ), 7.27 (1H, m, ArH), 7.45-7.60 (3H, m, ArH), 7.65 (1H, s, ArH), 7.87 (2H, m, ArH), 8.09 (2H, m, ArH), 10.51 (1H, s, NH).

HPLC: retention time 3.60 min [Method A]. TLC: Rf 0.40 (50% EtOAc/hexane).

### Experiment 4

#### Preparation and Analysis of 116102

N-[3-(4-bromo-1-methylpyrazol-3-yl)phenyl][2-thienyl]carboxamide

To thiophene-2-carbonyl chloride (11 $\mu\text{L}$ , 0.09mmol) in  $\text{CH}_2\text{Cl}_2$  (1mL) was added dropwise a solution of 3-(3-aminophenyl)-4-bromo-1-methylpyrazole (25mg, 0.09mmol) and triethylamine (14 $\mu\text{L}$ , 0.09mmol) in  $\text{CH}_2\text{Cl}_2$  (0.5mL). The reaction mixture was stirred for 16 h and concentrated. Chromatography on flash silica (50% EtOAc/hexane) gave the <sup>30</sup> title compound as a colourless solid (24mg, 68%), m.p. 127.8-128.6°C (EtOAc/hexane).

MS (ES+):  $m/z$  (%) = 364 ( $M+H^{81}\text{Br}$ , 96), 362 ( $M+H^{79}\text{Br}$ , 100).

<sup>1</sup>H-NMR (CD<sub>3</sub>OD): δ = 3.81 (3H, s, CH<sub>3</sub>), 7.19 (2H, m, ArH), 7.48-7.58 (2H, m, ArH), 7.68-7.83 (3H, m, ArH), 7.93 (1H, dd, J=1.0, 3.8, ArH).

HPLC: retention time 3.12 min [Method A]. TLC: Rf 0.30 (30% EtOAc/hexane).

## Experiment 6

### Preparation and Analysis of 116120

N-[3-(4-bromo-1-methylpyrazol-3-yl)phenyl][4-chlorophenyl]carboxamide

To 4-chlorobenzoyl chloride (15mg, 0.08mmol) in CH<sub>2</sub>Cl<sub>2</sub> (1mL) was added dropwise a solution of 3-(3-aminophenyl)-4-bromo-1-methylpyrazole (21mg, 0.08mmol) and triethylamine (12μL, 0.08mmol) in CH<sub>2</sub>Cl<sub>2</sub> (0.5mL). The mixture was stirred for 16 h and concentrated. Chromatography on flash silica (50% EtOAc/hexane) gave the title compound as a colourless solid (23mg, 72%), m.p. 184.4-184.8°C (EtOAc/hexane).

MS (ES+): m/z (%) = 394 (M+H <sup>81</sup>Br <sup>37</sup>Cl, 34), 392 (M+H <sup>79</sup>Br <sup>37</sup>Cl (<sup>81</sup>Br <sup>35</sup>Cl), 100), 390 (M+H <sup>79</sup>Br <sup>35</sup>Cl, 67).

<sup>1</sup>H-NMR (DMSO d<sub>6</sub>): δ = 3.79 (3H, s, CH<sub>3</sub>), 7.25 (1H, d, J=7.9, ArH), 7.51-7.65 (3H, m, ArH), 7.69 (1H, s, ArH), 7.90 (2H, m, ArH), 8.00 (2H, m, ArH), 10.51 (1H, s, NH).

HPLC: retention time 3.40 min [Method A]. TLC: Rf 0.35 (50% EtOAc/hexane).

### Experiment 7

#### Preparation and Analysis of 116137

N-[3-(4-bromo-1-methylpyrazol-3-yl)phenyl]-2-[4-(trifluoromethoxy)phenyl]acetamide

5

A solution of 3-(3-aminophenyl)-4-bromo-1-methylpyrazole (35mg, 0.14mmol) and triethylamine (23 $\mu$ L, 0.17mmol) in DMF (0.5mL) was added in one portion to a stirred solution of 4-trifluoromethoxyphenylacetic acid (31mg, 0.14mmol), HBTU (53mg, 0.14mmol) and HOBT (19mg, 0.14mmol) in DMF (1mL). The mixture was heated at 70°C  
10 for 24 h and then quenched with aqueous sodium bicarbonate solution. Ethyl acetate was added and the organic phase separated, washed with water (x3), brine, dried ( $MgSO_4$ ) and evaporated. Chromatography on flash silica (50%EtOAc/hexane) gave the title compound as a colourless solid (43mg, 68%), m.p. 141.2-142.5°C (EtOAc/hexane).

IR:  $\nu_{max}$  = 1684, 1592, 1510, 1253, 1217, 1157, 987, 798, 700  $cm^{-1}$ .

15 MS (ES+):  $m/z$  (%) = 456 ( $M+H^{81}Br$ , 100), 454 ( $M+H^{79}Br$ , 94).

$^1H$ -NMR (DMSO  $d_6$ ):  $\delta$  = 3.72 (2H, s,  $CH_2$ ), 3.75 (3H, s,  $CH_3$ ), 7.17 (1H, d,  $J=7.7$ , ArH), 7.33 (2H, d,  $J=8.7$ , ArH), 7.38-7.51 (3H, m, ArH), 7.62-7.73 (3H, m, ArH), 10.44 (1H, s, NH).

HPLC: retention time 3.52 min [Method A].

20

### Experiment 8

#### Preparation and Analysis of 116174

N-[3-(4-bromo-1-methylpyrazol-3-yl)phenyl]-2-(3-fluorophenyl)acetamide

25

A mixture of 3-(3-aminophenyl)-4-bromo-1-methylpyrazole (30 mg, 0.12 mmol), 3-fluorophenylacetic acid (18 mg, 0.12 mmol), 1-hydroxybenzotriazole hydrate (16 mg, 0.12 mmol) and 2-(1H-benzotriazole-1-yl)-1,1,3,3-tetramethyluronium hexafluoro-phosphate (46 mg, 0.12 mmol) were dissolved in chloroform (1.5 ml). N, N-Diisopropylethylamine (0.02 ml, 0.13 mmol) was added and the mixture stirred at room temperature for 16h. The reaction mixture was then poured into brine and the organic layer washed with further brine, dried over magnesium sulphate and then concentrated in vacuo. The crude product was purified by column chromatography (ethyl acetate-toluene, 1:1), giving the title compound (12 mg, 26 %). Rf 0.41 (ethyl acetate-toluene, 1:1).

HPLC (Method B): retention time 7.07 min (100 %).  $\delta_H$  ( $CDCl_3$ ) 3.77 (2H, s), 3.83 (3H, s), 7.02 – 7.20 (4H, m), 7.54 (1H, s), 7.60 – 7.63 (1H, m). MS (AP+):  $m/z$  (%) = 390 (M + H  $^{81}Br$ , 100), 388 (M + H  $^{79}Br$ , 100).

### Experiment 11

#### Preparation and Analysis of 116177

N-[3-(4-bromo-1-methylpyrazol-3-yl)phenyl]-2-(4-nitrophenyl)acetamide

A mixture of 3-(3-aminophenyl)-4-bromo-1-methylpyrazole (30 mg, 0.12 mmol), 4-nitrophenylacetic acid (22 mg, 0.12 mmol), 1-hydroxybenzotriazole hydrate (16 mg, 0.12 mmol) and 2-(1H-benzotriazole-1-yl)-1,1,3,3-tetramethyluronium hexafluorophosphate (46 mg, 0.12 mmol) were dissolved in chloroform (1.5 ml). N, N-Diisopropylethylamine (0.02 ml, 0.13 mmol) was added and the mixture stirred at room temperature for 16h. The reaction mixture was then poured into brine and the organic layer washed with further brine, dried over magnesium sulphate and then concentrated in vacuo. The crude product was purified by column chromatography (ethyl acetate-toluene, 1:1), giving the title compound (9 mg, 18 %). Rf 0.19 (ethyl acetate-toluene, 1:1).

HPLC (Method B): retention time 7.22 min (94.30 %).  $\delta_H$  ( $CDCl_3$ ) 3.83 (3H, s), 3.87 (2H, s), 7.18 – 7.23 (1H, m), 7.42 – 7.65 (7H, m), 8.22 – 8.30 (2H, m). MS (AP+):  $m/z$  (%) = 417 ( $M + H^{81}Br$ , 100), 415 ( $M + H^{79}Br$ , 100).

### Experiment 12

#### Preparation and Analysis of 116178

N-[3-(4-bromo-1-methylpyrazol-3-yl)phenyl]-2-(2-methoxyphenyl)acetamide

25

A mixture of 3-(3-aminophenyl)-4-bromo-1-methylpyrazole (30 mg, 0.12 mmol), 2-methoxyphenylacetic acid (20 mg, 0.12 mmol), 1-hydroxybenzotriazole hydrate (16 mg, 0.12 mmol) and 2-(1H-benzotriazole-1-yl)-1,1,3,3-tetramethyluronium hexafluorophosphate (46 mg, 0.12 mmol) were dissolved in chloroform (1.5 ml). N, N-Diisopropylethylamine (0.02 ml, 0.13 mmol) was added and the mixture stirred at room temperature for 16h. The reaction mixture was then poured into brine and the organic layer washed with further brine, dried over magnesium sulphate and then concentrated in vacuo. The crude

product was purified by column chromatography (chloroform-methanol, 99:1), giving the title compound (18 mg, 38 %) as a colourless solid. R<sub>f</sub> 0.65 (chloroform-methanol, 98:2).

HPLC (Method B): retention time 7.16 min (100 %). δ<sub>H</sub> (CDCl<sub>3</sub>) 3.76 (2H, s), 3.83 (3H, s), 3.98 (3H, s), 6.97 – 7.06 (2H, m), 7.11 – 7.16 (1H, m), 7.31 – 7.50 (4H, m), 7.53 (1H, s), 7.57 – 7.60 (1H, m), 7.91 (1H, br s). MS (AP-): *m/z* (%) = 400 (M – H <sup>81</sup>Br, 90), 398 (M – H <sup>79</sup>Br, 100).

### Experiment 13

#### Preparation and Analysis of 116192

10 {[3-(4-bromo-1-methylpyrazol-3-yl)phenyl]amino}-N-(1,1-dimethylethoxy)carboxamide

To di-*tert*-butyl dicarbonate (36mg, 0.17mmol) in methanol (1mL) was added dropwise a solution of 3-(3-aminophenyl)-4-bromo-1-methylpyrazole (42mg, 0.17mmol) in methanol (1mL). The mixture was stirred for 16 h and concentrated. Chromatography on flash silica (40%EtOAc/heaxne) gave the title compound as a colourless solid (29mg, 49%)

15 (EtOAc/hexane).

MS (CI-): *m/z* (%) = 352 (M-H <sup>81</sup>Br, 100), 350 (M-H <sup>79</sup>Br, 96).

<sup>1</sup>H-NMR (DMSO d<sub>6</sub>): δ = 1.46 (9H, s, 3xCH<sub>3</sub>), 3.73 (3H, s, CH<sub>3</sub>), 7.07 (1H, m, ArH), 7.42 (1H, t, J=7.7, ArH), 7.53-7.60 (2H, m, ArH), 7.64 (1H, s, ArH), 9.57 (1H, s, NH).

20 HPLC: retention time 7.15 min [Method B].

One or the other (as indicated) of the two following synthetic protocols was used to generate each of the compounds below:

#### Protocol A:

25 To an isocyanate (1mmol) in CH<sub>2</sub>Cl<sub>2</sub> (4mL) was added dropwise a solution of 3-(3-aminophenyl)-4-bromo-1-methylpyrazole (1mmol) in CH<sub>2</sub>Cl<sub>2</sub> (4mL). The mixture was stirred for 16 hours and concentrated. Chromatography on flash silica (20%-80% EtOAc/hexane) followed by recrystallisation gave the pure urea.

#### Protocol B:

30 To a stirred solution of triphosgene (0.33mmol) in CH<sub>2</sub>Cl<sub>2</sub> (4mL) was added dropwise a solution of 3-(3-aminophenyl)-4-bromo-1-methylpyrazole (1mmol) and triethylamine (2mmol) in CH<sub>2</sub>Cl<sub>2</sub> (4mL). After 1 hour, an aniline was added (1mmol). The

reaction mixture was stirred for 16 hours and concentrated. Chromatography on flash silica (20%-80%EtOAc/hexane) followed by recrystallisation gave the pure urea.

## Experiment 36

## Preparation and Analysis of 116147

{[3-(4-bromo-1-methylpyrazol-3-yl)phenyl]amino}-N-(4-cyanophenyl)carboxamide

[Protocol B] – 4-aminoboronitrile

25 colourless solid (EtOAc/hexane)

MS (ES+):  $m/z$  (%) = 398 ( $M+H - ^{81}Br$ , 100), 396 ( $M+H - ^{79}Br$ , 96). $^1H$ -NMR (MeOH d<sub>4</sub>):  $\delta$  = 3.81 (3H, s, NCH<sub>3</sub>), 7.12 (1H, m, ArH), 7.46-7.57 (3H, m, ArH), 7.62-7.69 (5H, m, ArH).

HPLC: retention time 3.12 min.

30

## Experiment 37

## Preparation and Analysis of AR116148

{[3-(4-bromo-1-methylpyrazol-3-yl)phenyl]amino}-N-(2-cyanophenyl)carboxamide

## [Protocol B] – 2-aminobenzonitrile

colourless solid (EtOAc/hexane)

MS (ES+):  $m/z$  (%) = 398 ( $M+H^{81}Br$ , 95), 396 ( $M+H^{79}Br$ , 100).

$^1H$ -NMR ( $CDCl_3$ ):  $\delta$  = 3.79 (3H, s,  $CH_3$ ), 7.13-7.28 (2H, m, ArH), 7.49 (1H, t, J=7.8, ArH), 7.57 (1H, m, ArH), 7.62 (1H, m, ArH), 7.65-7.71 (2H, m, ArH), 7.78 (1H, m, ArH), 8.07 (1H, d, J=8.6, ArH), 8.83 (1H, s, NH), 9.62 (1H, s, NH).

HPLC: retention time 3.05 min [Method A].

## Experiment 38

## Preparation and Analysis of 116182

{[3-(4-bromo-1-methylpyrazol-3-yl)phenyl]amino}-N-(4-fluorophenylmethyl)carboxamide

## [Protocol B] – 4-fluorobenzylamine

colourless solid, m.p. 185.5-186.6°C (EtOAc/hexane).

MS (ES+):  $m/z$  (%) = 405 ( $M+H^{81}Br$ , 97), 403 ( $M+H^{79}Br$ , 100).

$^1H$ -NMR ( $DMSO d_6$ ):  $\delta$  = 3.75 (3H, s,  $CH_3$ ), 4.28 (2H, d, J=6.0,  $CH_2$ ), 6.73 (1H, t, J=5.9, NH), 7.01 (1H, d, J=7.5, ArH), 7.10-7.18 (2H, m, ArH), 7.27-7.41 (4H, m, ArH), 7.56 (1H, s, ArH), 7.62 (1H, s, ArH), 8.82 (1H, s, NH).

HPLC: retention time 3.10 min [Method A].

TLC: retention factor 0.25 (50% EtOAc/hexane).

20

## Experiment 39

## Preparation and Analysis of 116183

{[3-(4-bromo-1-methylpyrazol-3-yl)phenyl]amino}-N-(3,4-dimethoxyphenylmethyl)carboxamide

## [Protocol B] – 3,4-dimethoxybenzylamine

colourless solid, m.p. 174.9-175.5°C (EtOAc/hexane).

MS (CI+):  $m/z$  (%) = 447 ( $M+H^{81}Br$ , 100), 445 ( $M+H^{79}Br$ , 92).

$^1H$ -NMR ( $DMSO d_6$ ):  $\delta$  = 3.71 (3H, s,  $CH_3$ ), 3.73 (3H, s,  $CH_3$ ), 3.76 (3H, s,  $CH_3$ ), 4.22 (2H, d, J=5.8,  $CH_2$ ), 6.62 (1H, t, J=5.7, NH), 6.80 (1H, m, ArH), 6.89 (2H, m, ArH), 6.98 (1H, m, ArH), 7.36-7.51 (3H, m, ArH), 7.63 (1H, s, ArH), 8.76 (1H, s, NH).

HPLC: retention time 2.86 min [Method A].

TLC: retention factor 0.20 (50% EtOAc/hexane).

## Experiment 40

## Preparation and Analysis of 116184

{[3-(4-bromo-1-methylpyrazol-3-yl)phenyl]amino}-N-(3,4,5-trimethoxyphenylmethyl)carboxamide  
[Protocol B] – 3,4,5-trimethoxybenzylamine

5 colourless solid (EtOAc/hexane).

MS (CI+):  $m/z$  (%) = 477 ( $M+H^{81}Br$ , 100), 475 ( $M+H^{79}Br$ , 95).

$^1H$ -NMR (DMSO  $d_6$ ):  $\delta$  = 3.63 (3H, s, OCH<sub>3</sub>), 3.75 (9H, s, 3xCH<sub>3</sub>), 4.21 (1H, d, J=5.9, CH<sub>2</sub>), 6.61 (2H, s, ArH), 6.65 (1H, t, J=5.9, NH), 6.99 (1H, m, ArH), 7.40 (1H, t, J=7.7, ArH), 7.45 (1H, m, ArH), 7.56 (1H, m, ArH), 7.64 (1H, s, ArH), 8.77 (1H, s, NH).

10 HPLC: retention time 5.91 min [Method B].

TLC: retention factor 0.50 (50% EtOAc/hexane).

## Experiment 41

## Preparation and Analysis of 116185

{[3-(4-bromo-1-methylpyrazol-3-yl)phenyl]amino}-N-(2-methylphenylmethyl)carboxamide  
[Protocol B] – 2-methylbenzylamine

colourless solid (EtOAc/hexane).

MS (CI+):  $m/z$  (%) = 401 ( $M+H^{81}Br$ , 96), 399 ( $M+H^{79}Br$ , 100).

$^1H$ -NMR (DMSO  $d_6$ ):  $\delta$  = 2.28 (3H, s, CH<sub>3</sub>), 3.76 (3H, s, NCH<sub>3</sub>), 4.28 (1H, d, J=5.8, CH<sub>2</sub>), 6.60 (1H, t, J=5.8, NH), 7.01 (1H, m, ArH), 7.15 (3H, m, ArH), 7.24 (1H, m, ArH), 7.38-7.50 (2H, m, ArH), 7.57 (1H, m, ArH), 7.65 (1H, s, ArH), 8.77 (1H, s, NH).

HPLC: retention time 2.74 min [Method A].

TLC: retention factor 0.20 (50% EtOAc/hexane).

## Experiment 42

## Preparation and Analysis of 116189

{[3-(4-bromo-1-methylpyrazol-3-yl)phenyl]amino}-N-(4-methoxyphenylmethyl)carboxamide  
[Protocol B] – 4-methoxybenzylamine

colourless solid (EtOAc/hexane).

MS (CI+):  $m/z$  (%) = 417 ( $M+H^{81}Br$ , 94), 415 ( $M+H^{79}Br$ , 100).

$^1H$ -NMR (DMSO  $d_6$ ):  $\delta$  = 3.72 (3H, s, CH<sub>3</sub>), 3.77 (3H, s, NCH<sub>3</sub>), 4.22 (1H, d, J=5.9, CH<sub>2</sub>), 6.62 (1H, t, J=5.9, NH), 6.90 (2H, d, J=8.8, ArH), 7.00 (1H, m, ArH), 7.23 (2H, d,

J=8.8, ArH), 7.39 (1H, t, J=7.8, ArH), 7.43 (1H, m, ArH), 7.56 (1H, m, ArH), 7.64 (1H, s, ArH), 8.73 (1H, s, NH).

HPLC: retention time 6.41 min [Method B].

TLC: retention factor 0.25 (50% EtOAc/hexane).

5

### Experiment 43

#### Preparation and Analysis of 116194

{[3-(4-bromo-1-methylpyrazol-3-yl)phenyl]amino}-N-[2-(4-methoxy)phenylethyl]carboxamide

[Protocol B] – 2-(4-methoxyphenyl)ethylamine

10 colourless solid (EtOAc/hexane).

MS (ES+):  $m/z$  (%) = 431 ( $M+H^{81}Br$ , 95), 429 ( $M+H^{79}Br$ , 100).

$^1H$ -NMR (DMSO  $d_6$ ):  $\delta$  = 2.68 (2H, t, J=7.1, CH<sub>2</sub>), 3.31 (2H, m, CH<sub>2</sub>), 3.71 (3H, s, CH<sub>3</sub>), 3.77 (3H, s, CH<sub>3</sub>), 6.16 (1H, t, J=5.8, NH), 6.87 (2H, d, J=8.6, ArH), 6.99 (1H, dt, J=1.4, 7.3, ArH), 7.16 (2H, d, J=8.6, ArH), 7.33-7.48 (2H, m, ArH), 7.52 (1H, m, ArH), 15 7.63 (1H, s, ArH), 8.71 (1H, s, NH).

HPLC: retention time 6.62 min [Method B].

An important point that can be derived from the foregoing data is that by using a constitutively activated form of the receptor in the direct identification of candidate 20 compounds, the selectivity of the compounds is exceptional: as those in the art appreciate, the homology between the human 5HT2A and 5HT2C receptors is about 95%, and even with such homology, certain of the directly identified compounds evidence a 4-order-of-magnitude (10,000-fold) selectivity separation (116100). This is important for pharmaceutical compositions in that such selectivity can help to reduce side-effects associated with interaction 25 of a drug with a non-target receptor.

Different embodiments of the invention will consist of different constitutively activated receptors, different expression systems, different assays, and different compounds. Those skilled in the art will understand which receptors to use with which expression systems and assay methods. All are considered within the scope of the teaching of this invention. In 30 addition, those skilled in the art will recognize that various modifications, additions, substitutions, and variations to the illustrative examples set forth herein can be made without departing from the spirit of the invention and are, therefore, considered within the scope of the invention.

**CLAIMS**

We claim:

1. A cDNA encoding a constitutively active, non-endogenous version, of a human 5HT<sub>2C</sub> serotonin receptor comprising SEQ. ID NO. 28.
- 5 2. A constitutively active non-endogenous human 5HT<sub>2C</sub> serotonin receptor encoded by the cDNA of SEQ ID NO. 28 comprising SEQ ID NO. 29.
3. A cDNA encoding a constitutively active, non-endogenous version, of a human 5HT<sub>2A</sub> serotonin receptor comprising SEQ. ID NO. 30.
- 10 4. A constitutively active non-endogenous human 5HT<sub>2A</sub> serotonin receptor encoded by the cDNA of SEQ ID NO. 30 comprising SEQ ID NO. 31.
5. A cDNA encoding a constitutively active, non-endogenous version, of a human 5HT<sub>2A</sub> serotonin receptor comprising SEQ. ID NO. 32.
- 15 6. A constitutively active non-endogenous human 5HT<sub>2A</sub> serotonin receptor encoded by the cDNA of SEQ ID NO. 32 comprising SEQ ID NO. 33.
7. A method for identifying whether a candidate compound is an inverse agonist to a non-endogenous human 5HT<sub>2</sub> serotonin receptor comprising the steps of:
  - a. contacting the candidate compound with a non-endogenous human 5HT<sub>2</sub> serotonin receptor ; and
  - 20 b. determining, by measurement of a second messenger response whether said compound is an inverse agonist.
8. The method of claim 7 in which the non-endogenous human 5HT<sub>2</sub> serotonin receptor comprises SEQ ID NO. 29.
9. The method of claim 7 in which the non-endogenous human 5HT<sub>2</sub> serotonin receptor comprises SEQ ID NO. 31.
- 25 10. The method of claim 7 in which the non-endogenous human 5HT<sub>2</sub> serotonin receptor comprises SEQ ID NO. 33.
11. An inverse agonist identified by the method of claim 7.
12. A reagent for screening compounds to determine whether the compounds are inverse agonists at human 5HT<sub>2</sub> serotonin receptors comprising a membrane fraction from mammalian cells transfected with and expressing a cDNA encoding for a constitutively active, non-endogenous version, of a human 5HT<sub>2</sub> serotonin receptor

in which the constitutively active non-endogenous human 5HT<sub>2</sub> receptor is expressed on the cell surface.

13. A reagent for screening compounds to determine whether the compounds are inverse agonists at human 5HT<sub>2</sub> serotonin receptors comprising mammalian cells which produce a second messenger response, transfected with and expressing a cDNA encoding for a constitutively active, non-endogenous version, of a human 5HT<sub>2</sub> serotonin receptor in which the constitutively active non-endogenous human 5HT<sub>2</sub> receptor is expressed on the cell surface.

5            14. A method for modulating by inverse agonism the activity of a human 5HT<sub>2A</sub> serotonin receptor by contacting the receptor with a compound of formula:

10

Wherein:

W is lower alkyl (C<sub>1-6</sub>), or halogen;

V is lower alkyl (C<sub>1-6</sub>), or halogen;

15            X is either Oxygen or Sulfur;

Y is NR<sup>2</sup>R<sup>3</sup>, or (CH<sub>2</sub>)<sub>m</sub>R<sup>4</sup>, or O(CH<sub>2</sub>)<sub>n</sub>R<sup>4</sup>;

Z is lower alkyl (C<sub>1-6</sub>);

m = 0 - 4

n = 0 - 4

20            R<sup>1</sup> is H or lower alkyl (C<sub>1-4</sub>);

R<sup>2</sup> is H or lower alkyl(C<sub>1-4</sub>);

R<sup>3</sup> and R<sup>4</sup> are independently a C<sub>1-6</sub> alkyl, or C<sub>2-6</sub> alkenyl, or cycloalkyl, or aryl group and each said group may be optionally substituted by up to four substituents in any position independently selected from CF<sub>3</sub>, CCl<sub>3</sub>, Me, NO<sub>2</sub>, OH, OMe, OEt, CONR<sup>5</sup>R<sup>6</sup>, NR<sup>5</sup>R<sup>6</sup>, OCF<sub>3</sub>, SMe, COOR<sup>7</sup>, SO<sub>2</sub>NR<sup>5</sup>R<sup>6</sup>, SO<sub>3</sub>R<sup>7</sup>, COMe, COEt, CO-lower alkyl, SCF<sub>3</sub>CN, C<sub>2-6</sub> alkenyl, H, halogens, C<sub>1-4</sub> alkoxy, C<sub>3-6</sub> cycloalkyl, C<sub>1-6</sub> alkyl, aryl, and aryloxy wherein each of the C<sub>3-6</sub> cycloalkyl, C<sub>1-6</sub> alkyl, aryl, or aryloxy groups may be further optionally substituted by up to four substituents in any position independently selected from CF<sub>3</sub>, CCl<sub>3</sub>, Me, NO<sub>2</sub>, OH, OMe, OEt, CONR<sup>5</sup>R<sup>6</sup>, NR<sup>5</sup>R<sup>6</sup>, NHCOCH<sub>3</sub>, OCF<sub>3</sub>, SMe, COOR<sup>7</sup>, SO<sub>3</sub>R<sup>7</sup>, SO<sub>2</sub>NR<sup>5</sup>R<sup>6</sup>, COMe, COEt, CO-lower alkyl, SCF<sub>3</sub>, CN, C<sub>2-6</sub> alkenyl, H, halogens, C<sub>1-4</sub> alkoxy, C<sub>3-6</sub> cycloalkyl, C<sub>1-6</sub> alkyl, and aryl;

R<sup>5</sup> and R<sup>6</sup> are independently a H, or C<sub>1-6</sub> alkyl, or C<sub>2-6</sub> alkenyl, or cycloalkyl, or aryl, or CH<sub>2</sub> aryl group and each said group may be optionally substituted by up to four substituents in any position independently selected from CF<sub>3</sub>, CCl<sub>3</sub>, Me, NO<sub>2</sub>, OH, OMe, OEt, CONR<sup>7</sup>R<sup>8</sup>, NR<sup>7</sup>R<sup>8</sup>, NHCOCH<sub>3</sub>, OCF<sub>3</sub>, SMe, COOR<sup>9</sup>, SO<sub>3</sub>R<sup>7</sup>, SO<sub>2</sub>NR<sup>7</sup>R<sup>8</sup>, COMe, COEt, CO-lower alkyl, SCF<sub>3</sub>, CN, C<sub>2-6</sub> alkenyl, H, halogens, C<sub>1-4</sub> alkoxy, C<sub>3-6</sub> cycloalkyl, C<sub>1-6</sub> alkyl, and aryl wherein each of the C<sub>3-6</sub> cycloalkyl, C<sub>1-6</sub> alkyl, or aryl groups may be further optionally substituted by up to four substituents in any position independently selected from CF<sub>3</sub>, CCl<sub>3</sub>, Me, NO<sub>2</sub>, OH, OMe, OEt, CONR<sup>8</sup>R<sup>9</sup>, NR<sup>8</sup>R<sup>9</sup>, NHCOCH<sub>3</sub>, OCF<sub>3</sub>, SMe, COOR<sup>7</sup>, SO<sub>2</sub>NR<sup>8</sup>R<sup>9</sup>, SO<sub>3</sub>R<sup>7</sup>, COMe, COEt, CO-lower alkyl, SCF<sub>3</sub>, CN, C<sub>2-6</sub> alkenyl, H, halogens, C<sub>1-4</sub> alkoxy, C<sub>3-6</sub> cycloalkyl, C<sub>1-6</sub> alkyl, and aryl,

or R<sup>5</sup> and R<sup>6</sup> may form part of a 5, 6 or 7 membered cyclic structure which may be either saturated or unsaturated and that may contain up to four heteroatoms selected from O, N or S and said cyclic structure may be optionally substituted by up to four substituents in any position independently selected from CF<sub>3</sub>, CCl<sub>3</sub>, Me, NO<sub>2</sub>, OH, OMe, OEt, OCF<sub>3</sub>, SMe, COOR<sup>7</sup>, SO<sub>2</sub>NR<sup>8</sup>R<sup>9</sup>, SO<sub>3</sub>R<sup>7</sup>, NHCOCH<sub>3</sub>, COEt, COMe, or halogen;

R<sup>7</sup> may be independently selected from H or C<sub>1-6</sub> alkyl;

R<sup>8</sup> and R<sup>9</sup> are independently a H, or C<sub>1-6</sub> alkyl, or C<sub>2-6</sub> alkenyl, or cycloalkyl, or aryl, or CH<sub>2</sub>aryl group and each said group may be optionally substituted by up to four substituents in any position independently selected from

halogen, CF<sub>3</sub>, OCF<sub>3</sub>, OEt, CCl<sub>3</sub>, Me, NO<sub>2</sub>, OH, OMe, SMe, COMe, CN, COOR<sup>7</sup>, SO<sub>3</sub>R<sup>7</sup>, COEt, NHCOCH<sub>3</sub>, or aryl;

an aryl moiety can be a 5 or 6 membered aromatic heterocyclic ring (containing up to 4 hetero atoms independently selected from N, O, or S) or a 6 membered aromatic non-heterocyclic ring or a polycycle;

15. A method for modulating by inverse agonism the activity of a human 5HT<sub>2A</sub> serotonin receptor by contacting the receptor with a compound of formula:

(B)

Wherein:

10        W is Me, or Et, or halogen;

X is either Oxygen or Sulfur;

Y is NR<sup>2</sup>R<sup>3</sup>, or (CH<sub>2</sub>)<sub>m</sub>R<sup>4</sup>, or O(CH<sub>2</sub>)<sub>n</sub>R<sup>4</sup>;

Z is lower alkyl (C<sub>1-6</sub>);

m = 0 - 4

15        n = 0 - 4

R¹ is H or lower alkyl (C<sub>1-4</sub>);

R² is H or lower alkyl(C<sub>1-4</sub>);

20        R<sup>3</sup> and R<sup>4</sup> are independently a C<sub>1-6</sub> alkyl, or C<sub>2-6</sub> alkenyl, or cycloalkyl, or aryl group and each said group may be optionally substituted by up to four substituents in any position independently selected from CF<sub>3</sub>, CCl<sub>3</sub>, Me, NO<sub>2</sub>, OH, OMe, OEt, CONR<sup>5</sup>R<sup>6</sup>, NR<sup>5</sup>R<sup>6</sup>, OCF<sub>3</sub>, SMe, COOR<sup>7</sup>, SO<sub>2</sub>NR<sup>5</sup>R<sup>6</sup>, SO<sub>3</sub>R<sup>7</sup>, COMe, COEt, CO-lower alkyl, SCF<sub>3</sub>CN, C<sub>2-6</sub> alkenyl, H, halogens, C<sub>1-4</sub> alkoxy, C<sub>3-6</sub>

cycloalkyl, C<sub>1-6</sub> alkyl, aryl, and aryloxy wherein each of the C<sub>3-6</sub> cycloalkyl, C<sub>1-6</sub> alkyl, aryl, or aryloxy groups may be further optionally substituted by up to four substituents in any position independently selected from CF<sub>3</sub>, CCl<sub>3</sub>, Me, NO<sub>2</sub>, OH, OMe, OEt, CONR<sup>5</sup>R<sup>6</sup>, NR<sup>5</sup>R<sup>6</sup>, NHCOCH<sub>3</sub>, OCF<sub>3</sub>, SMe, COOR<sup>7</sup>, SO<sub>3</sub>R<sup>7</sup>, SO<sub>2</sub>NR<sup>5</sup>R<sup>6</sup>, COMe, COEt, CO-lower alkyl, SCF<sub>3</sub>, CN, C<sub>2-6</sub> alkenyl, H, halogens, C<sub>1-4</sub> alkoxy, C<sub>3-6</sub> cycloalkyl, C<sub>1-6</sub> alkyl, and aryl;

R<sup>5</sup> and R<sup>6</sup> are independently a H, or C<sub>1-6</sub> alkyl, or C<sub>2-6</sub> alkenyl, or cycloalkyl, or aryl, or CH<sub>2</sub> aryl group and each said group may be optionally substituted by up to four substituents in any position independently selected from CF<sub>3</sub>, CCl<sub>3</sub>, Me, NO<sub>2</sub>, OH, OMe, OEt, CONR<sup>7</sup>R<sup>8</sup>, NR<sup>7</sup>R<sup>8</sup>, NHCOCH<sub>3</sub>, OCF<sub>3</sub>, SMe, COOR<sup>9</sup>, SO<sub>3</sub>R<sup>7</sup>, SO<sub>2</sub>NR<sup>7</sup>R<sup>8</sup>, COMe, COEt, CO-lower alkyl, SCF<sub>3</sub>, CN, C<sub>2-6</sub> alkenyl, H, halogens, C<sub>1-4</sub> alkoxy, C<sub>3-6</sub> cycloalkyl, C<sub>1-6</sub> alkyl, and aryl wherein each of the C<sub>3-6</sub> cycloalkyl, C<sub>1-6</sub> alkyl, or aryl groups may be further optionally substituted by up to four substituents in any position independently selected from CF<sub>3</sub>, CCl<sub>3</sub>, Me, NO<sub>2</sub>, OH, OMe, OEt, CONR<sup>8</sup>R<sup>9</sup>, NR<sup>8</sup>R<sup>9</sup>, NHCOCH<sub>3</sub>, OCF<sub>3</sub>, SMe, COOR<sup>7</sup>, SO<sub>2</sub>NR<sup>8</sup>R<sup>9</sup>, SO<sub>3</sub>R<sup>7</sup>, COMe, COEt, CO-lower alkyl, SCF<sub>3</sub>, CN, C<sub>2-6</sub> alkenyl, H, halogens, C<sub>1-4</sub> alkoxy, C<sub>3-6</sub> cycloalkyl, C<sub>1-6</sub> alkyl, and aryl,

or R<sup>5</sup> and R<sup>6</sup> may form part of a 5, 6 or 7 membered cyclic structure which may be either saturated or unsaturated and that may contain up to four heteroatoms selected from O, N or S and said cyclic structure may be optionally substituted by up to four substituents in any position independently selected from CF<sub>3</sub>, CCl<sub>3</sub>, Me, NO<sub>2</sub>, OH, OMe, OEt, OCF<sub>3</sub>, SMe, COOR<sup>7</sup>, SO<sub>2</sub>NR<sup>8</sup>R<sup>9</sup>, SO<sub>3</sub>R<sup>7</sup>, NHCOCH<sub>3</sub>, COEt, COMe, or halogen;

R<sup>7</sup> may be independently selected from H or C<sub>1-6</sub> alkyl;

R<sup>8</sup> and R<sup>9</sup> are independently a H, or C<sub>1-6</sub> alkyl, or C<sub>2-6</sub> alkenyl, or cycloalkyl, or aryl, or CH<sub>2</sub>aryl group and each said group may be optionally substituted by up to four substituents in any position independently selected from halogen, CF<sub>3</sub>, OCF<sub>3</sub>, OEt, CCl<sub>3</sub>, Me, NO<sub>2</sub>, OH, OMe, SMe, COMe, CN, COOR<sup>7</sup>, SO<sub>3</sub>R<sup>7</sup>, COEt, NHCOCH<sub>3</sub>, or aryl;

an aryl moiety can be a 5 or 6 membered aromatic heterocyclic ring (containing up to 4 hetero atoms independently selected from N, O, or S) or a 6 membered aromatic non-heterocyclic ring or a polycycle.

16. A method for modulating by inverse agonism the activity of a human 5HT<sub>2A</sub> serotonin receptor by contacting the receptor with a compound of formula:

Wherein:

5        Preferably R<sup>1</sup> and R<sup>2</sup> are H.

Preferably W is Br.

Preferably X is O.

Preferably Z is Me.

10      R<sup>3</sup> is C<sub>1-6</sub> alkyl, or C<sub>2-6</sub> alkenyl, or cycloalkyl, or aryl group and each said group may be optionally substituted by up to four substituents in any position independently selected from CF<sub>3</sub>, CCl<sub>3</sub>, Me, NO<sub>2</sub>, OH, OMe, OEt, CONR<sup>5</sup>R<sup>6</sup>, NR<sup>5</sup>R<sup>6</sup>, OCF<sub>3</sub>, SMe, COOR<sup>7</sup>, SO<sub>2</sub>NR<sup>5</sup>R<sup>6</sup>, SO<sub>3</sub>R<sup>7</sup>, COMe, COEt, CO-lower alkyl, SCF<sub>3</sub>CN, C<sub>2-6</sub> alkenyl, H, halogens, C<sub>1-4</sub> alkoxy, C<sub>3-6</sub> cycloalkyl, C<sub>1-6</sub> alkyl, aryl, and aryloxy wherein each of the C<sub>3-6</sub> cycloalkyl, C<sub>1-6</sub> alkyl, aryl, or aryloxy groups may be further optionally substituted by up to four substituents in any position independently selected from CF<sub>3</sub>, CCl<sub>3</sub>, Me, NO<sub>2</sub>, OH, OMe, OEt, CONR<sup>5</sup>R<sup>6</sup>, NR<sup>5</sup>R<sup>6</sup>, NHCOCH<sub>3</sub>, OCF<sub>3</sub>, SMe, COOR<sup>7</sup>, SO<sub>3</sub>R<sup>7</sup>, SO<sub>2</sub>NR<sup>5</sup>R<sup>6</sup>, COMe, COEt, CO-lower alkyl, SCF<sub>3</sub>, CN, C<sub>2-6</sub> alkenyl, H, halogens, C<sub>1-4</sub> alkoxy, C<sub>3-6</sub> cycloalkyl, C<sub>1-6</sub> alkyl, and aryl;

20      R<sup>5</sup> and R<sup>6</sup> are independently a H, or C<sub>1-6</sub> alkyl, or C<sub>2-6</sub> alkenyl, or cycloalkyl, or aryl, or CH<sub>2</sub> aryl group and each said group may be optionally substituted by up to four substituents in any position independently selected from CF<sub>3</sub>, CCl<sub>3</sub>, Me, NO<sub>2</sub>, OH, OMe, OEt, CONR<sup>7</sup>R<sup>8</sup>, NR<sup>7</sup>R<sup>8</sup>, NHCOCH<sub>3</sub>, OCF<sub>3</sub>, SMe.

COOR<sup>9</sup>, SO<sub>3</sub>R<sup>7</sup>, SO<sub>2</sub>NR<sup>7</sup>R<sup>8</sup>, COMe, COEt, CO-lower alkyl, SCF<sub>3</sub>, CN, C<sub>2-6</sub> alkenyl, H, halogens, C<sub>1-4</sub> alkoxy, C<sub>3-6</sub> cycloalkyl, C<sub>1-6</sub> alkyl, and aryl wherein each of the C<sub>3-6</sub> cycloalkyl, C<sub>1-6</sub> alkyl, or aryl groups may be further optionally substituted by up to four substituents in any position independently selected from CF<sub>3</sub>, CCl<sub>3</sub>, Me, NO<sub>2</sub>, OH, OMe, OEt, CONR<sup>8</sup>R<sup>9</sup>, NR<sup>8</sup>R<sup>9</sup>, NHCOCH<sub>3</sub>, OCF<sub>3</sub>, SMe, COOR<sup>7</sup>, SO<sub>2</sub>NR<sup>8</sup>R<sup>9</sup>, SO<sub>3</sub>R<sup>7</sup>, COMe, COEt, CO-lower alkyl, SCF<sub>3</sub>, CN, C<sub>2-6</sub> alkenyl, H, halogens, C<sub>1-4</sub> alkoxy, C<sub>3-6</sub> cycloalkyl, C<sub>1-6</sub> alkyl, and aryl,

or R<sup>5</sup> and R<sup>6</sup> may form part of a 5, 6 or 7 membered cyclic structure which may be either saturated or unsaturated and that may contain up to four heteroatoms selected from O, N or S and said cyclic structure may be optionally substituted by up to four substituents in any position independently selected from CF<sub>3</sub>, CCl<sub>3</sub>, Me, NO<sub>2</sub>, OH, OMe, OEt, OCF<sub>3</sub>, SMe, COOR<sup>7</sup>, SO<sub>2</sub>NR<sup>8</sup>R<sup>9</sup>, SO<sub>3</sub>R<sup>7</sup>, NHCOCH<sub>3</sub>, COEt, COMe, or halogen;

R<sup>7</sup> may be independently selected from H or C<sub>1-6</sub> alkyl;

R<sup>8</sup> and R<sup>9</sup> are independently a H, or C<sub>1-6</sub> alkyl, or C<sub>2-6</sub> alkenyl, or cycloalkyl, or aryl, or CH<sub>2</sub>aryl group and each said group may be optionally substituted by up to four substituents in any position independently selected from halogen, CF<sub>3</sub>, OCF<sub>3</sub>, OEt, CCl<sub>3</sub>, Me, NO<sub>2</sub>, OH, OMe, SMe, COMe, CN, COOR<sup>7</sup>, SO<sub>3</sub>R<sup>7</sup>, COEt, NHCOCH<sub>3</sub>, or aryl;

an aryl moiety can be a 5 or 6 membered aromatic heterocyclic ring (containing up to 4 hetero atoms independently selected from N, O, or S) or a 6 membered aromatic non-heterocyclic ring or a polycycle.

17. A method for modulating by inverse agonism the activity of a human 5HT2A serotonin receptor by contacting the receptor with a compound of formula:

Wherein:

Preferably R<sup>1</sup> is H.

Preferably W is Br.

5 Preferably X is O.

Preferably Z is Me.

n = 0 - 4

10 R<sup>4</sup> is C<sub>1-6</sub> alkyl, or C<sub>2-6</sub> alkenyl, or cycloalkyl, or aryl group and each said group may be optionally substituted by up to four substituents in any position independently selected from CF<sub>3</sub>, CCl<sub>3</sub>, Me, NO<sub>2</sub>, OH, OMe, OEt, CONR<sup>5</sup>R<sup>6</sup>, NR<sup>5</sup>R<sup>6</sup>, OCF<sub>3</sub>, SMe, COOR<sup>7</sup>, SO<sub>2</sub>NR<sup>5</sup>R<sup>6</sup>, SO<sub>3</sub>R<sup>7</sup>, COMe, COEt, CO-lower alkyl, SCF<sub>3</sub>CN, C<sub>2-6</sub> alkenyl, H, halogens, C<sub>1-4</sub> alkoxy, C<sub>3-6</sub> cycloalkyl, C<sub>1-6</sub> alkyl, aryl, and aryloxy wherein each of the C<sub>3-6</sub> cycloalkyl, C<sub>1-6</sub> alkyl, aryl, or aryloxy groups may be further optionally substituted by up to four substituents in any position independently selected from CF<sub>3</sub>, CCl<sub>3</sub>, Me, NO<sub>2</sub>, OH, OMe, OEt, CONR<sup>5</sup>R<sup>6</sup>, NR<sup>5</sup>R<sup>6</sup>, NHCOCH<sub>3</sub>, OCF<sub>3</sub>, SMe, COOR<sup>7</sup>, SO<sub>3</sub>R<sup>7</sup>, SO<sub>2</sub>NR<sup>5</sup>R<sup>6</sup>, COMe, COEt, CO-lower alkyl, SCF<sub>3</sub>, CN, C<sub>2-6</sub> alkenyl, H, halogens, C<sub>1-4</sub> alkoxy, C<sub>3-6</sub> cycloalkyl, C<sub>1-6</sub> alkyl, and aryl;

20 R<sup>5</sup> and R<sup>6</sup> are independently a H, or C<sub>1-6</sub> alkyl, or C<sub>2-6</sub> alkenyl, or cycloalkyl, or aryl, or CH<sub>2</sub> aryl group and each said group may be optionally substituted by up to four substituents in any position independently selected from CF<sub>3</sub>, CCl<sub>3</sub>, Me, NO<sub>2</sub>, OH, OMe, OEt, CONR<sup>7</sup>R<sup>8</sup>, NR<sup>7</sup>R<sup>8</sup>, NHCOCH<sub>3</sub>, OCF<sub>3</sub>, SMe, COOR<sup>9</sup>, SO<sub>3</sub>R<sup>7</sup>, SO<sub>2</sub>NR<sup>7</sup>R<sup>8</sup>, COMe, COEt, CO-lower alkyl, SCF<sub>3</sub>, CN, C<sub>2-6</sub> alkenyl.

H, halogens, C<sub>1-4</sub> alkoxy, C<sub>3-6</sub> cycloalkyl, C<sub>1-6</sub> alkyl, and aryl wherein each of the C<sub>3-6</sub> cycloalkyl, C<sub>1-6</sub> alkyl, or aryl groups may be further optionally substituted by up to four substituents in any position independently selected from CF<sub>3</sub>, CCl<sub>3</sub>, Me, NO<sub>2</sub>, OH, OMe, OEt, CONR<sup>8</sup>R<sup>9</sup>, NR<sup>8</sup>R<sup>9</sup>, NHCOCH<sub>3</sub>, OCF<sub>3</sub>, SMe, COOR<sup>7</sup>, SO<sub>2</sub>NR<sup>8</sup>R<sup>9</sup>, SO<sub>3</sub>R<sup>7</sup>, COMe, COEt, CO-lower alkyl, SCF<sub>3</sub>, CN, C<sub>2-6</sub> alkenyl, H, halogens, C<sub>1-4</sub> alkoxy, C<sub>3-6</sub> cycloalkyl, C<sub>1-6</sub> alkyl, and aryl,

or R<sup>5</sup> and R<sup>6</sup> may form part of a 5, 6 or 7 membered cyclic structure which may be either saturated or unsaturated and that may contain up to four heteroatoms selected from O, N or S and said cyclic structure may be optionally substituted by up to four substituents in any position independently selected from CF<sub>3</sub>, CCl<sub>3</sub>, Me, NO<sub>2</sub>, OH, OMe, OEt, OCF<sub>3</sub>, SMe, COOR<sup>7</sup>, SO<sub>2</sub>NR<sup>8</sup>R<sup>9</sup>, SO<sub>3</sub>R<sup>7</sup>, NHCOCH<sub>3</sub>, COEt, COMe, or halogen;

R<sup>7</sup> may be independently selected from H or C<sub>1-6</sub> alkyl;

R<sup>8</sup> and R<sup>9</sup> are independently a H, or C<sub>1-6</sub> alkyl, or C<sub>2-6</sub> alkenyl, or cycloalkyl, or aryl, or CH<sub>2</sub>aryl group and each said group may be optionally substituted by up to four substituents in any position independently selected from halogen, CF<sub>3</sub>, OCF<sub>3</sub>, OEt, CCl<sub>3</sub>, Me, NO<sub>2</sub>, OH, OMe, SMe, COMe, CN, COOR<sup>7</sup>, SO<sub>3</sub>R<sup>7</sup>, COEt, NHCOCH<sub>3</sub>, or aryl;

an aryl moiety can be a 5 or 6 membered aromatic heterocyclic ring (containing up

to 4 hetero atoms independently selected from N, O, or S) or a 6 membered aromatic non-heterocyclic ring or a polycycle.

18. A method for modulating by inverse agonism the activity of a human 5HT2A serotonin receptor by contacting the receptor with a compound of formula:

Wherein:

Preferably W is Br.

Preferably X is O.

Preferably Z is Me.

Preferably R¹ is H.

m = 0 - 4

R⁴ is C<sub>1-6</sub> alkyl, or C<sub>2-6</sub> alkenyl, or cycloalkyl, or aryl group and each said group may be optionally substituted by up to four substituents in any position independently selected from CF<sub>3</sub>, CCl<sub>3</sub>, Me, NO<sub>2</sub>, OH, OMe, OEt, CONR<sup>5</sup>R<sup>6</sup>, NR<sup>5</sup>R<sup>6</sup>, OCF<sub>3</sub>, SMe, COOR<sup>7</sup>, SO<sub>2</sub>NR<sup>5</sup>R<sup>6</sup>, SO<sub>3</sub>R<sup>7</sup>, COMe, COEt, CO-lower alkyl, SCF<sub>3</sub>CN, C<sub>2-6</sub> alkenyl, H, halogens, C<sub>1-4</sub> alkoxy, C<sub>3-6</sub> cycloalkyl, C<sub>1-6</sub> alkyl, aryl, and aryloxy wherein each of the C<sub>3-6</sub> cycloalkyl, C<sub>1-6</sub> alkyl, aryl, or aryloxy groups may be further optionally substituted by up to four substituents in any position independently selected from CF<sub>3</sub>, CCl<sub>3</sub>, Me, NO<sub>2</sub>, OH, OMe, OEt, CONR<sup>5</sup>R<sup>6</sup>, NR<sup>5</sup>R<sup>6</sup>, NHCOCH<sub>3</sub>, OCF<sub>3</sub>, SMe, COOR<sup>7</sup>, SO<sub>3</sub>R<sup>7</sup>, SO<sub>2</sub>NR<sup>5</sup>R<sup>6</sup>, COMe, COEt, CO-lower alkyl, SCF<sub>3</sub>, CN, C<sub>2-6</sub> alkenyl, H, halogens, C<sub>1-4</sub> alkoxy, C<sub>3-6</sub> cycloalkyl, C<sub>1-6</sub> alkyl, and aryl;

10

15

20

R<sup>5</sup> and R<sup>6</sup> are independently a H, or C<sub>1-6</sub> alkyl, or C<sub>2-6</sub> alkenyl, or cycloalkyl, or aryl, or CH<sub>2</sub> aryl group and each said group may be optionally substituted by up to four substituents in any position independently selected from CF<sub>3</sub>, CCl<sub>3</sub>, Me, NO<sub>2</sub>, OH, OMe, OEt, CONR<sup>7</sup>R<sup>8</sup>, NR<sup>7</sup>R<sup>8</sup>, NHCOCH<sub>3</sub>, OCF<sub>3</sub>, SMe, COOR<sup>9</sup>, SO<sub>3</sub>R<sup>7</sup>, SO<sub>2</sub>NR<sup>7</sup>R<sup>8</sup>, COMe, COEt, CO-lower alkyl, SCF<sub>3</sub>, CN, C<sub>2-6</sub> alkenyl.

H, halogens, C<sub>1-4</sub> alkoxy, C<sub>3-6</sub> cycloalkyl, C<sub>1-6</sub> alkyl, and aryl wherein each of the C<sub>3-6</sub> cycloalkyl, C<sub>1-6</sub> alkyl, or aryl groups may be further optionally substituted by up to four substituents in any position independently selected from CF<sub>3</sub>, CCl<sub>3</sub>, Me, NO<sub>2</sub>, OH, OMe, OEt, CONR<sup>8</sup>R<sup>9</sup>, NR<sup>8</sup>R<sup>9</sup>, NHCOCH<sub>3</sub>, OCF<sub>3</sub>, SMe, COOR<sup>7</sup>, SO<sub>2</sub>NR<sup>8</sup>R<sup>9</sup>, SO<sub>3</sub>R<sup>7</sup>, COMe, COEt, CO-lower alkyl, SCF<sub>3</sub>, CN, C<sub>2-6</sub> alkenyl, H, halogens, C<sub>1-4</sub> alkoxy, C<sub>3-6</sub> cycloalkyl, C<sub>1-6</sub> alkyl, and aryl,

or R<sup>5</sup> and R<sup>6</sup> may form part of a 5, 6 or 7 membered cyclic structure which may be either saturated or unsaturated and that may contain up to four heteroatoms selected from O, N or S and said cyclic structure may be optionally substituted by up to four substituents in any position independently selected from CF<sub>3</sub>, CCl<sub>3</sub>, Me, NO<sub>2</sub>, OH, OMe, OEt, OCF<sub>3</sub>, SMe, COOR<sup>7</sup>, SO<sub>2</sub>NR<sup>8</sup>R<sup>9</sup>, SO<sub>3</sub>R<sup>7</sup>, NHCOCH<sub>3</sub>, COEt, COMe, or halogen;

R<sup>7</sup> may be independently selected from H or C<sub>1-6</sub> alkyl;

R<sup>8</sup> and R<sup>9</sup> are independently a H, or C<sub>1-6</sub> alkyl, or C<sub>2-6</sub> alkenyl, or cycloalkyl, or aryl, or CH<sub>2</sub>aryl group and each said group may be optionally substituted by up to four substituents in any position independently selected from halogen, CF<sub>3</sub>, OCF<sub>3</sub>, OEt, CCl<sub>3</sub>, Me, NO<sub>2</sub>, OH, OMe, SMe, COMe, CN, COOR<sup>7</sup>, SO<sub>3</sub>R<sup>7</sup>, COEt, NHCOCH<sub>3</sub>, or aryl;

an aryl moiety can be a 5 or 6 membered aromatic heterocyclic ring (containing up

to 4 hetero atoms independently selected from N, O, or S) or a 6 membered aromatic non-heterocyclic ring or a polycycle.

## 19. A compound of formula (C)

(C)

Wherein:

5            W is Me, or Et, or halogen;

          X is either Oxygen or Sulfur;

          Y is  $NR^2R^3$ , or  $(CH_2)_mR^4$ , or  $O(CH_2)_nR^4$ ;

          Z is lower alkyl ( $C_{1-6}$ );

          m = 0 - 4;

10          n = 0 - 4;

$R^1$  is H or lower alkyl ( $C_{1-4}$ );

$R^2$  is H or lower alkyl( $C_{1-4}$ );

$R^3$  is a  $C_{1-6}$  alkyl, or  $C_{2-6}$  alkenyl, or cycloalkyl, or  $(CH_2)_k$ aryl group ( $k = 1 - 4$ ), preferably  $k = 1$ , and each said group may be optionally substituted by up to four substituents in any position independently selected from  $CF_3$ ,  $CCl_3$ , Me,  $NO_2$ , OH,  $OMe$ ,  $OEt$ ,  $CONR^5R^6$ ,  $NR^5R^6$ ,  $OCF_3$ ,  $SMe$ ,  $COOR^7$ ,  $SO_2NR^5R^6$ ,  $SO_3R^7$ , COMe, COEt, CO-lower alkyl,  $SCF_3CN$ ,  $C_{2-6}$  alkenyl, H, halogens,  $C_{1-4}$  alkoxy,  $C_{3-6}$  cycloalkyl,  $C_{1-6}$  alkyl, aryl, and aryloxy wherein each of the  $C_{3-6}$  cycloalkyl,  $C_{1-6}$  alkyl, aryl, or aryloxy groups may be further optionally substituted by up to four substituents in any position independently selected from  $CF_3$ ,  $CCl_3$ , Me,  $NO_2$ , OH,  $OMe$ ,  $OEt$ ,  $CONR^5R^6$ ,  $NR^5R^6$ ,  $NHCOCH_3$ ,  $OCF_3$ ,  $SMe$ ,  $COOR^7$ ,  $SO_3R^7$ .

15

20

$\text{SO}_2\text{NR}^5\text{R}^6$ , COMe, COEt, CO-lower alkyl,  $\text{SCF}_3$ , CN,  $\text{C}_{2-6}$  alkenyl, H, halogens,  $\text{C}_{1-4}$  alkoxy,  $\text{C}_{3-6}$  cycloalkyl,  $\text{C}_{1-6}$  alkyl, and aryl;

$\text{R}^4$  is a  $\text{C}_{1-6}$  alkyl, or  $\text{C}_{2-6}$  alkenyl, or cycloalkyl, or aryl group and each said group may be optionally substituted by up to four substituents in any position independently selected from  $\text{CF}_3$ ,  $\text{CCl}_3$ , Me,  $\text{NO}_2$ , OH, OMe, OEt,  $\text{CONR}^5\text{R}^6$ ,  $\text{NR}^5\text{R}^6$ ,  $\text{OCF}_3$ , SMe, COOR<sup>7</sup>,  $\text{SO}_2\text{NR}^5\text{R}^6$ ,  $\text{SO}_3\text{R}^7$ , COMe, COEt, CO-lower alkyl,  $\text{SCF}_3\text{CN}$ ,  $\text{C}_{2-6}$  alkenyl, H, halogens,  $\text{C}_{1-4}$  alkoxy,  $\text{C}_{3-6}$  cycloalkyl,  $\text{C}_{1-6}$  alkyl, aryl, and aryloxy wherein each of the  $\text{C}_{3-6}$  cycloalkyl,  $\text{C}_{1-6}$  alkyl, aryl, or aryloxy groups may be further optionally substituted by up to four substituents in any position independently selected from  $\text{CF}_3$ ,  $\text{CCl}_3$ , Me,  $\text{NO}_2$ , OH, OMe, OEt,  $\text{CONR}^5\text{R}^6$ ,  $\text{NR}^5\text{R}^6$ ,  $\text{NHCOCH}_3$ ,  $\text{OCF}_3$ , SMe, COOR<sup>7</sup>,  $\text{SO}_3\text{R}^7$ ,  $\text{SO}_2\text{NR}^5\text{R}^6$ , COMe, COEt, CO-lower alkyl,  $\text{SCF}_3$ , CN,  $\text{C}_{2-6}$  alkenyl, H, halogens,  $\text{C}_{1-4}$  alkoxy,  $\text{C}_{3-6}$  cycloalkyl,  $\text{C}_{1-6}$  alkyl, and aryl;

$\text{R}^5$  and  $\text{R}^6$  are independently a H, or  $\text{C}_{1-6}$  alkyl, or  $\text{C}_{2-6}$  alkenyl, or cycloalkyl, or aryl, or  $\text{CH}_2$  aryl group and each said group may be optionally substituted by up to four substituents in any position independently selected from  $\text{CF}_3$ ,  $\text{CCl}_3$ , Me,  $\text{NO}_2$ , OH, OMe, OEt,  $\text{CONR}^7\text{R}^8$ ,  $\text{NR}^7\text{R}^8$ ,  $\text{NHCOCH}_3$ ,  $\text{OCF}_3$ , SMe, COOR<sup>9</sup>,  $\text{SO}_3\text{R}^7$ ,  $\text{SO}_2\text{NR}^7\text{R}^8$ , COMe, COEt, CO-lower alkyl,  $\text{SCF}_3$ , CN,  $\text{C}_{2-6}$  alkenyl, H, halogens,  $\text{C}_{1-4}$  alkoxy,  $\text{C}_{3-6}$  cycloalkyl,  $\text{C}_{1-6}$  alkyl, and aryl wherein each of the  $\text{C}_{3-6}$  cycloalkyl,  $\text{C}_{1-6}$  alkyl, or aryl groups may be further optionally substituted by up to four substituents in any position independently selected from  $\text{CF}_3$ ,  $\text{CCl}_3$ , Me,  $\text{NO}_2$ , OH, OMe, OEt,  $\text{CONR}^8\text{R}^9$ ,  $\text{NR}^8\text{R}^9$ ,  $\text{NHCOCH}_3$ ,  $\text{OCF}_3$ , SMe, COOR<sup>7</sup>,  $\text{SO}_2\text{NR}^8\text{R}^9$ ,  $\text{SO}_3\text{R}^7$ , COMe, COEt, CO-lower alkyl,  $\text{SCF}_3$ , CN,  $\text{C}_{2-6}$  alkenyl, H, halogens,  $\text{C}_{1-4}$  alkoxy,  $\text{C}_{3-6}$  cycloalkyl,  $\text{C}_{1-6}$  alkyl, and aryl,

or  $\text{R}^5$  and  $\text{R}^6$  may form part of a 5, 6 or 7 membered cyclic structure which may be either saturated or unsaturated and that may contain up to four heteroatoms selected from O, N or S and said cyclic structure may be optionally substituted by up to four substituents in any position independently selected from  $\text{CF}_3$ ,  $\text{CCl}_3$ , Me,  $\text{NO}_2$ , OH, OMe, OEt,  $\text{OCF}_3$ , SMe, COOR<sup>7</sup>,  $\text{SO}_2\text{NR}^8\text{R}^9$ ,  $\text{SO}_3\text{R}^7$ ,  $\text{NHCOCH}_3$ , COEt, COMe, or halogen;

$\text{R}^7$  may be independently selected from H or  $\text{C}_{1-6}$  alkyl;

$\text{R}^8$  and  $\text{R}^9$  are independently a H, or  $\text{C}_{1-6}$  alkyl, or  $\text{C}_{2-6}$  alkenyl, or cycloalkyl, or aryl, or  $\text{CH}_2$  aryl group and each said group may be optionally

substituted by up to four substituents in any position independently selected from halogen, CF<sub>3</sub>, OCF<sub>3</sub>, OEt, CCl<sub>3</sub>, Me, NO<sub>2</sub>, OH, OMe, SMe, COMe, CN, COOR<sup>7</sup>, SO<sub>3</sub>R<sup>7</sup>, COEt, NHCOCH<sub>3</sub>, or aryl;

an aryl moiety can be a 5 or 6 membered aromatic heterocyclic ring (containing up to 4 hetero atoms independently selected from N, O, or S) or a 6 membered aromatic non-heterocyclic ring or a polycycle;

with the proviso that said compound is not:

N-[3-(4-bromo-1-methylpyrazol-3-yl)phenyl][methylamino]carboxamide, or

N-[3-(4-bromo-1-methylpyrazol-3-yl)phenyl][{(4-trifluoromethoxy)phenyl}amino]

carboxamide, or

N-[3-(4-bromo-1-methylpyrazol-3-yl)phenyl][2-chlorophenyl]carboxamide, or

N-[3-(4-bromo-1-methylpyrazol-3-yl)phenyl][2-chloro-3-pyridyl]carboxamide, or

N-[3-(4-bromo-1-methylpyrazol-3-yl)phenyl][trichloromethyl]carboxamide.

20. The use of a compound of claim 19 for the manufacture of a medicament.

## SEQUENCE LISTING

## (1) GENERAL INFORMATION:

- (i) APPLICANTS: Arena Pharmaceuticals, Inc. and Tripos, Inc.
- (ii) TITLE OF INVENTION: Non-Endogenous, Constitutively Activated Human Serotonin Receptors and Small Molecule Modulators Thereof
- (iii) NUMBER OF SEQUENCES: 33
- (iv) CORRESPONDENCE ADDRESS:
  - (A) ADDRESSEE: Woodcock Washburn Kurtz Mackiewicz & Norris LLP
  - (B) STREET: One Liberty Place - 46th Floor
  - (C) CITY: Philadelphia
  - (D) STATE: PA
  - (E) COUNTRY: USA
  - (F) ZIP: 19103
- (v) COMPUTER READABLE FORM:
  - (A) MEDIUM TYPE: Floppy disk
  - (B) COMPUTER: IBM PC compatible
  - (C) OPERATING SYSTEM: WINDOWS NT, Version #4.0
  - (D) SOFTWARE: PatentIn Release #1.0, Version #1.30
- (vi) CURRENT APPLICATION DATA:
  - (A) APPLICATION NUMBER: PCT/US99/08168
  - (B) FILING DATE: April 14, 1999
  - (C) CLASSIFICATION: 435
- (viii) ATTORNEY/AGENT INFORMATION:
  - (A) NAME: Mark J. Rosen
  - (B) REGISTRATION NUMBER: 39,822
- (ix) TELECOMMUNICATION INFORMATION:
  - (A) TELEPHONE: (215) 568-3100
  - (B) TELEFAX: (215) 568-3439

## (2) INFORMATION FOR SEQ ID NO:1:

- (i) SEQUENCE CHARACTERISTICS:
  - (A) LENGTH: 27 base pairs
  - (B) TYPE: nucleic acid
  - (C) STRANDEDNESS: single
  - (D) TOPOLOGY: linear
- (ii) MOLECULE TYPE: DNA (genomic)

## (xi) SEQUENCE DESCRIPTION: SEQ ID NO:1:

GACCTCGAGG TTGCTTAAGA CTGAAGC

27

## (3) INFORMATION FOR SEQ ID NO:2:

(i) SEQUENCE CHARACTERISTICS:  
(A) LENGTH: 27 base pairs  
(B) TYPE: nucleic acid  
(C) STRANDEDNESS: single  
(D) TOPOLOGY: linear

(ii) MOLECULE TYPE: DNA (genomic)

(xi) SEQUENCE DESCRIPTION: SEQ ID NO:2:

ATTTCTAGAC ATATGTAGCT TGTACCG

27

(4) INFORMATION FOR SEQ ID NO:3:

(i) SEQUENCE CHARACTERISTICS:  
(A) LENGTH: 50 base pairs  
(B) TYPE: nucleic acid  
(C) STRANDEDNESS: single  
(D) TOPOLOGY: linear

(ii) MOLECULE TYPE: DNA (genomic)

(xi) SEQUENCE DESCRIPTION: SEQ ID NO:3:

CTAGGGGCAC CATGCAGGCT ATCAAACAATG AAAGAAAAGC TAAGAAAGTC

50

(5) INFORMATION FOR SEQ ID NO:4:

(i) SEQUENCE CHARACTERISTICS:  
(A) LENGTH: 50 base pairs  
(B) TYPE: nucleic acid  
(C) STRANDEDNESS: single  
(D) TOPOLOGY: linear

(ii) MOLECULE TYPE: DNA (genomic)

(xi) SEQUENCE DESCRIPTION: SEQ ID NO:4:

CAAGGACTTT CTTAGCTTTT CTTCATTGT TGATAGCCTG CATGGTGCCC

50

(6) INFORMATION FOR SEQ ID NO:5:

(i) SEQUENCE CHARACTERISTICS:  
(A) LENGTH: 26 base pairs  
(B) TYPE: nucleic acid  
(C) STRANDEDNESS: single  
(D) TOPOLOGY: linear

(ii) MOLECULE TYPE: DNA (genomic)

(xi) SEQUENCE DESCRIPTION: SEQ ID NO:5:

GACCTCGAGT CCTTCTACAC CTCATC

26

(7) INFORMATION FOR SEQ ID NO:6:

(i) SEQUENCE CHARACTERISTICS:

- (A) LENGTH: 30 base pairs
- (B) TYPE: nucleic acid
- (C) STRANDEDNESS: single
- (D) TOPOLOGY: linear

(ii) MOLECULE TYPE: DNA (genomic)

(xi) SEQUENCE DESCRIPTION: SEQ ID NO:6:

TGCTCTAGAT TCCAGATAGG TGAAAATTG

30

(8) INFORMATION FOR SEQ ID NO:7:

(i) SEQUENCE CHARACTERISTICS:

- (A) LENGTH: 31 base pairs
- (B) TYPE: nucleic acid
- (C) STRANDEDNESS: single
- (D) TOPOLOGY: linear

(ii) MOLECULE TYPE: DNA (genomic)

(xi) SEQUENCE DESCRIPTION: SEQ ID NO:7:

CAAAGAAAGT ACTGGGCATC GTCTTCTTCC T

31

(9) INFORMATION FOR SEQ ID NO:8:

(i) SEQUENCE CHARACTERISTICS:

- (A) LENGTH: 31 base pairs
- (B) TYPE: nucleic acid
- (C) STRANDEDNESS: single
- (D) TOPOLOGY: linear

(ii) MOLECULE TYPE: DNA (genomic)

(xi) SEQUENCE DESCRIPTION: SEQ ID NO:8:

CCGCTCGAGT ACTGCGCCGA CAAGCTTTGA T

31

(10) INFORMATION FOR SEQ ID NO:9:

(i) SEQUENCE CHARACTERISTICS:

- (A) LENGTH: 38 base pairs
- (B) TYPE: nucleic acid
- (C) STRANDEDNESS: single
- (D) TOPOLOGY: linear

(ii) MOLECULE TYPE: DNA (genomic)

(xi) SEQUENCE DESCRIPTION: SEQ ID NO:9:

CGATGCCAG CACTTCGAA GCTTTCTTT CATTGTTG

38

(11) INFORMATION FOR SEQ ID NO:10:

(i) SEQUENCE CHARACTERISTICS:

- (A) LENGTH: 36 base pairs
- (B) TYPE: nucleic acid
- (C) STRANDEDNESS: single
- (D) TOPOLOGY: linear

(ii) MOLECULE TYPE: DNA (genomic)

(xi) SEQUENCE DESCRIPTION: SEQ ID NO:10:

AAAAGCTTCG AAAGTGCTGG GCATCGTCTT CTTCCT

36

(12) INFORMATION FOR SEQ ID NO:11

(i) SEQUENCE CHARACTERISTICS:

- (A) LENGTH: 30 base pairs
- (B) TYPE: nucleic acid
- (C) STRANDEDNESS: single
- (D) TOPOLOGY: linear

(ii) MOLECULE TYPE: DNA (genomic)

(xi) SEQUENCE DESCRIPTION: SEQ ID NO:1:

TGCTCTAGAT TCCAGATAGG TGAAAACTTG

30

(13) INFORMATION FOR SEQ ID NO:12:

(i) SEQUENCE CHARACTERISTICS:

- (A) LENGTH: 19 base pairs
- (B) TYPE: nucleic acid
- (C) STRANDEDNESS: single
- (D) TOPOLOGY: linear

(ii) MOLECULE TYPE: DNA (genomic)

(xi) SEQUENCE DESCRIPTION: SEQ ID NO:12:

CGTGTCTCTC CTTACTTCA

19

(14) INFORMATION FOR SEQ ID NO:13:

(i) SEQUENCE CHARACTERISTICS:  
(A) LENGTH: 36 base pairs  
(B) TYPE: nucleic acid  
(C) STRANDEDNESS: single  
(D) TOPOLOGY: linear

(ii) MOLECULE TYPE: DNA (genomic)

(xi) SEQUENCE DESCRIPTION: SEQ ID NO:13:

TCGGCGCAGT ACTTTGATAG TTAGAAAGTA GGTGAT

36

(15) INFORMATION FOR SEQ ID NO:14:

(i) SEQUENCE CHARACTERISTICS:  
(A) LENGTH: 38 base pairs  
(B) TYPE: nucleic acid  
(C) STRANDEDNESS: single  
(D) TOPOLOGY: linear

(ii) MOLECULE TYPE: DNA (genomic)

(xi) SEQUENCE DESCRIPTION: SEQ ID NO:14:

TTCTAACTAT CAAAGTACTG CGCCGACAAG CTTTGATG

38

(16) INFORMATION FOR SEQ ID NO:15:

(i) SEQUENCE CHARACTERISTICS:  
(A) LENGTH: 43 base pairs  
(B) TYPE: nucleic acid  
(C) STRANDEDNESS: single  
(D) TOPOLOGY: linear

(ii) MOLECULE TYPE: DNA (genomic)

(xi) SEQUENCE DESCRIPTION: SEQ ID NO:15:

## INTERNATIONAL SEARCH REPORT

International application No.

PCT/US99/08168

## A. CLASSIFICATION OF SUBJECT MATTER

IPC(6) :C07H 21/04; C07K 14/705; C12N 15/09, 15/63; C12Q 1/68  
 US CL : 536/23.5, 24.3; 435/7.1, 69.1, 320.1; 530/350

According to International Patent Classification (IPC) or to both national classification and IPC

## B. FIELDS SEARCHED

Minimum documentation searched (classification system followed by classification symbols)

U.S. : 536/23.5, 24.3; 435/7.1, 69.1, 320.1; 530/350

Documentation searched other than minimum documentation to the extent that such documents are included in the fields searched

Electronic data base consulted during the international search (name of data base and, where practicable, search terms used)

APS, MEDLINE, HCAPLUS, BIOSIS, EMBASE, JAPIO, WPIDS  
 search terms: sertotonin receptor, Sht2, agonist, antagonist, inverse agonist, chemical structure of compound A, B, i, II, III.

## C. DOCUMENTS CONSIDERED TO BE RELEVANT

Category*	Citation of document, with indication, where appropriate, of the relevant passages	Relevant to claim No.
X	HARTMAN, J.L. et al. Functional Reconstitution in Situ of 5-Hydroxytryptamine 2c (5HT2c) Receptors with Alpha-q and Inverse Agonism of 5HT2c Receptor Antagonists. J. Biol. Chem. 13 September 1996, Vol. 271, No. 37, pages 22591-22597, see entire document.	7
A,P	WO 98/24785 A1 (FUGI-SAWA PHARMACEUTICAL CO., LTD.) 11 June 1998, see entire document.	7, 18, 19

Further documents are listed in the continuation of Box C.  See patent family annex.

* Special categories of cited documents:	*T*	later document published after the international filing date or priority date and not in conflict with the application but cited to understand the principle or theory underlying the invention
*A* document defining the general state of the art which is not considered to be of particular relevance	*X*	document of particular relevance; the claimed invention cannot be considered novel or cannot be considered to involve an inventive step when the document is taken alone
*E* earlier document published on or after the international filing date	*Y*	document of particular relevance; the claimed invention cannot be considered to involve an inventive step when the document is combined with one or more other such documents, such combination being obvious to a person skilled in the art
*L* document which may throw doubts on priority claim(s) or which is cited to establish the publication date of another citation or other special reason (as specified)	&	document member of the same patent family
*O* document referring to an oral disclosure, use, exhibition or other means		
*P* document published prior to the international filing date but later than the priority date claimed		

Date of the actual completion of the international search

26 JULY 1999

Date of mailing of the international search report

28 AUG 1999

**INTERNATIONAL SEARCH REPORT**International application No.  
PCT/US99/08168**Box I Observations where certain claims were found unsearchable (Continuation of item 1 of first sheet)**

This international report has not been established in respect of certain claims under Article 17(2)(a) for the following reasons:

1.  Claims Nos.: because they relate to subject matter not required to be searched by this Authority, namely:
  
2.  Claims Nos.: 1-6, 8-10 and 15-17 because they relate to parts of the international application that do not comply with the prescribed requirements to such an extent that no meaningful international search can be carried out, specifically:  

Claims 1-6 and 8-10 require a sequence search of the amino acid sequence of the protein or nucleotide search of the polynucleotide. The sequences in computer readable form were defective. Claims 15-17 are not present in the application.
3.  Claims Nos.: because they are dependent claims and are not drafted in accordance with the second and third sentences of Rule 6.4(a).

**Box II Observations where unity of invention is lacking (Continuation of item 2 of first sheet)**

This International Searching Authority found multiple inventions in this international application, as follows:

Please See Extra Sheet.

1.  As all required additional search fees were timely paid by the applicant, this international search report covers all searchable claims.
2.  As all searchable claims could be searched without effort justifying an additional fee, this Authority did not invite payment of any additional fee.
3.  As only some of the required additional search fees were timely paid by the applicant, this international search report covers only those claims for which fees were paid, specifically claims Nos.: 7, 18 and 19
4.  No required additional search fees were timely paid by the applicant. Consequently, this international search report is restricted to the invention first mentioned in the claims; it is covered by claims Nos.:

**Remark on Protest**  

The additional search fees were accompanied by the applicant's protest.  
No protest accompanied the payment of additional search fees.

**INTERNATIONAL SEARCH REPORT**

International application No.

PCT/US99/08168

**BOX II. OBSERVATIONS WHERE UNITY OF INVENTION WAS LACKING**

This ISA found multiple inventions as follows:

This application contains the following inventions or groups of inventions which are not so linked as to form a single inventive concept under PCT Rule 13.1. In order for all inventions to be searched, the appropriate additional search fees must be paid.

Group I, claim(s)7, drawn to a method for identifying whether a candidate compound is an inverse agonist to a non-endogenous human 5HT2 serotonin receptor.

Group II, claim(s) 11, drawn to an agonist to a non-endogenous human 5HT2 serotonin receptor.

Group III, claim(s) 12 and 13, drawn to a reagent for screening compounds to determine whether the compounds are inverse agonists to human 5HT2 serotonin receptor.

Group IV, claim(s)14, drawn to a method for modulating by inverse agonism the activity of a human 5HT2a serotonin receptor by contacting the receptor with the compound A.

Group V, claim(s) 18, drawn to a method for modulating by inverse agonism the activity of a human 5HT2a serotonin receptor by contacting the receptor with the compound B.

Group VI, claim(s) 19, drawn to a method for modulating by inverse agonism the activity of a human 5HT2a serotonin receptor by contacting the receptor with the compound I.

Group VII, claim(s)20, drawn to a method for modulating by inverse agonism the activity of a human 5HT2a serotonin receptor by contacting the receptor with the compound II.

Group VIII, claim(s) 20, drawn to a method for modulating by inverse agonism the activity of a human 5HT2a serotonin receptor by contacting the receptor with the compound III.

Group IX, claim(s) 21 and 22, drawn to compound C and use for manufacture of a medicament.

Claims 15-17 are not grouped because they were not present in the application.

The inventions listed as Groups I-IX do not relate to a single inventive concept under PCT Rule 13.1 because, under PCT Rule 13.2, they lack the same or corresponding special technical features for the following reasons: The special technical feature of Group I is the method for identifying whether a candidate compound is an inverse agonist to a non-endogenous human 5HT2 serotonin receptor. Pursuant 37 CFR 1.474 (d), the claim is considered by the ISA/US to constitute the main invention, and none of the related Groups I-IX correspond to the main invention. Prior art teaches the special technical feature of Group I. Hartman et al (J. Biol. Chem., 1996, Vol. 271, No.3, pages 22591-22597) disclose a method for identifying whether a candidate compound is an inverse agonist to a non-endogenous human 5HT2 serotonin receptor. The method of Group I does not provide an advance over the prior art. The methods of Groups IV-VIII do not share a special technical feature in any pairing because the special technical feature is the inverse agonist, and each method is practiced by a different inverse agonist. The products of Groups II, III and IX do not share the technical feature in any pairing because the compounds are structurally different and capable of separate use and manufacture.
